Solutions Manual for

Machine Elements in Mechanical Design, 5th ed.

By: Robert L. Mott

Table of Contents	ii
MDESIGN software Included on the CD in the book	iii
Spreadsheets included on the CD in the Solutions Manual	x
<u>Solutions to end-of-chapter problems</u>	
Chapter 1: The Nature of Mechanical Design	1
Chapter 2: Materials in Mechanical Design	3
Chapter 3: Stress and Deformation Analysis	11
Chapter 4: Combined Stresses and Mohr's Circle	37
Chapter 5: Design for Different Types of Loading	71
Chapter 6: Columns	93
Chapter 7: Belt Drives and Chain Drives	106
Chapter 8: Kinematics of Gears	116
Chapter 9: Spur Gear Design	137
Chapter 10: Helical Gears, Bevel Gears, and Wormgearing	180
Chapter 11: Keys, Couplings, and Seals	214
Chapter 12: Shaft Design	218
Chapter 13: Tolerances and Fits	240
Chapter 14: Rolling Contact Bearings	245
Chapter 16: Plain Surface Bearings	251
Chapter 17: Linear Motion Elements	258
Chapter 18: Springs.....	262
Chapter 19: Fasteners	277
Chapter 20: Machine Frames, Bolted Connections, and Welded Joints	279
Chapter 21: Electric Motors and Controls	290
Chapter 22: Motion Control: Clutches and Brakes	293

MDESIGN Software - Its application to
Machine Elements in Mechanical Design, 5th edition
By: Robert L. Mott
Published by: Pearson Education - Prentice-Hall

General Description of the Software

A powerful computer-aided calculation software package called MDESIGN is included with each purchase of this book. A total of 66 modules divided among 15 categories make up the complete package, outlined in the Introduction to the software. The software is an updated version of one that first appeared in the 4th edition of *Machine Elements in Mechanical Design*.

The software was created by TEDATA, GMBH, a German company that has a long history of producing such software for professional use throughout Europe and many other parts of the world. The version included with this book has 32 modules that have general applicability or that were produced specially for the book, following the analysis and design methods presented in the book, most of which are patterned on methods and standards commonly used in the United States. The other 34 modules were developed primarily for use by professionals and conform to common practice in Europe as represented by DIN standards, VDI publications, and the popular reference book on machine elements often called Roloff/Matek Machine Elements, written by Herbert Wittel, Dieter Muhs, Dieter Jannasch, and Joachim Vobiek and published by Vieweg+Teubner, Wiesbaden, Germany, 2009.

Identification of the two types of MDESIGN modules listed in the Introduction to the software:

- The list identifies the 32 modules most closely aligned with this book by the symbol . The chapter and section of the book most relevant to each module is indicated. The text includes several sections where a special icon appears to indicate that the use of MDESIGN is pertinent to that topic.
- The other 34 modules are denoted by the symbol  and are more closely aligned to European standards. They may use terminology, notations, and symbols unfamiliar to those experienced primarily in U.S.-based practices.

It is important to note that the inclusion of this extensive and diverse set of modules can be useful to users of this book throughout the world as a means of expanding the breadth of knowledge of design practices in different regions. Furthermore, many users of the book are likely to engage in projects with industrial companies, design services, consultants, and university faculty members from many parts of the world and having these modules available can aid in communicating across traditional geographic boundaries and between different technical cultures.

Advice on Use of the MDESIGN Software

The following comments are directed primarily to those using this book as a learning tool either in college and university degree programs or in professional self-study.

The author's approach to the inclusion of calculation aids within initial learning of technical subject matter is:

- *Users of computer software and calculation aids must have solid understanding of the relevant principles of design and stress analysis to ensure that design decisions are based on reliable foundations.*
- *Software should be used only after mastering a given design methodology by careful study and practicing manual techniques.*
- *Then, data with known results can be applied to the software as a check on the understanding of the program's input data requirements, symbols and notation used, limits on the range of acceptable data, and analysis methods.*
- *Only then should users rely on implementation of design decisions based on output results from the software.*

General HELP for Running MDESIGN

An extensive 123-page help file can be accessed from the main menu ribbon. Particular attention should be paid to the Graphical User Interface section on pages 33-39 for those few modules that permit graphical data input.

Recommended Primary Uses for MDESIGN Software with this Book

Upon launching the MDESIGN software package, reading the Introduction, and opening the software, the left side of the initial screen will include the list of 15 categories of modules. Each category name is preceded by a plus-sign (+) that, when selected, yields the list of modules in that category. Double-clicking will open any selected module. Alternatively, you can right click and select Open.

The 32 modules most closely aligned with the presentations in the book, identified by the symbol  in the Introduction, are obviously those that should be considered first for incorporation into courses and individual study. Pertinent sections of the book for which these modules may be useful are indicated by the graphic symbol in the left margin.

Particularly for design projects and where multiple trials for design decisions are to be expected and where the large catalogs of data in MDESIGN can be accessed, the following modules enable learners to try many options in a short amount of time after learning the basic fundamentals. The following modules serve well these purposes.

Beam Calculations	Column Analysis	ISO Fit System
Statically determinate beams	Column Design	Parallel Keys
Statically indeterminate beams	Ball and Roller Bearings	V-belts
Helical Compression Springs	Plain Surface/Journal Bearings	Synchronous Belts
Helical Extension Springs	Clutches and Brakes (5 modules)	Roller Chains
Helical Torsion Springs	Combined Stresses/Mohr's Circle	Shafts-U.S. Standards

Certainly, in an academic learning situation, instructors must enforce expectations on when and where use of the MDESIGN software is accepted, expected, or prohibited.

The process for using any module should be as follows:

1. Open the relevant module and read the General Text Help screen in the lower left part of the opening page. This outlines the basic functions of the module, shows the technical bases for the analyses performed, and identifies relevant references, terms, and symbols. Be aware that for some modules, the text help has been translated from the original German language and the result may not be in adequate standard English.
2. Use the pull-down menu on that screen to peruse what other textual aids are included. These often elaborate on design approaches by,
 - a. Explaining unfamiliar terms
 - b. Stating typical units for input data or results
 - c. Setting acceptable limits on values of certain variables
 - d. Providing tables of data from which some input data must be selected by the user
3. Observe the graphic aids in the lower right of the opening page, again scrolling among all available topics. Some of these can be accessed directly from the Input page.
4. Peruse the data required for the input screen. Open any available help icons for text, data, or "choice" options to determine requirements or available options.
5. Under the Tools tab on the main menu ribbon, select the pull down menu on the Measures System icon and select U.S. System, Metric System, or All Systems. These choices set the primary units in which data are to be entered and for which output results will be shown. In any case, you have the option to change units for any item by passing the cursor over the unit and pulling down the local menu.
 - a. Pay special attention to the precision of results data shown on the Output pages. At times, only one or two significant figures of accuracy are displayed and that may not be adequate for your use. You may be able to select a smaller unit that will show higher precision. For example if a length of diameter measurement shows 6.0 in, selecting the *mil* unit (0.001 – thousandths) may show 6075 mils, indicating 6.075 in.
 - b. Note that the standard European Metric system uses the comma rather than the decimal point for separating digits in floating point calculations. For example, In the U.S. system a number may be 12.456; in Metric it will appear 12,456.
6. When all data are entered, select the Calculation tab on the main menu or, simply, press the F10 key on the keyboard to initiate the module's calculations. Note the following:
 - a. In some modules, intermediate data entry screens pop up for which some initial calculations have generated data on which subsequent design decisions are based. You are asked then to make the final decision before the complete results are found.

- b. After a short time for completing the calculations (typically only a few seconds), select the Output Page option at the upper left of the data page to see results.
 - c. Carefully evaluate results for reasonableness and check that proper units have been selected.
 - d. Some modules include internal checks on output to assess acceptability, with unacceptable results shown in RED. If that occurs, you must return to the Input Page and change design decisions, recalculate results, and re-evaluate their acceptability.
 - e. Consider the degree of optimization of any particular result and, where possible, make adjustments to hone into a more optimum design. *It is typical for mechanical design analyses to require proposing and analyzing several alternative solutions to achieve the most efficient and effective design.*
7. When the final result has been found, use the Print command to print out both the Input Page and the Output Page. It is essential for an instructor or a client to see complete records of the data used along with the results.

Descriptions of Selected Modules

The following sections describe certain topics from this book for which the use of MDESIGN is particularly pertinent. Suggestions for applying the modules are also given, but practice with known data is a good way to gain skill at entering data and seeking optimum results. Use of data taken from Example Problems from the text is highly recommended. However, there may be slight differences between results in book problems and those from MDESIGN because of rounding of numbers and slightly modified ways of making calculations.

Combined Stress and Mohr's Circle – Chapter 4

Module group: Shafts, Axles, and Beams. This module solves problems of the type featured in Sections 4-4 and 4-5 of the text in which data for applied normal and shear stresses in one plane are known and the program computes the maximum principal stress, the minimum principal stress, and the maximum shear stress. The complete Mohr's circle and the pertinent stress elements are also developed and included in the output.

Columns – Chapter 6 – Two modules: Column Analysis and Column Design

Module group: Shafts, Axles, and Beams. These modules follow closely the methodology used in the text for applying the Euler formula for long columns and the J. B. Johnson formula for short columns to either analysis or design problems. Loading can be either central or eccentric

and both straight and crooked columns can be analyzed. Problems of the types shown in the text in Example Problems 6-1 to 6-6

Belt Drives and Chain Drives – Chapter 7 – Three modules: V-Belts, U.S. Standards, Synchronous Belts, and Roller Chains ISO 10823

Module Group: Belt-, Chain Drives: These modules are pertinent to Sections 7-4 to 7-7. Each module contains large databases of commercially available products that can be selected for designs of power transmission drives. It is recommended that the use of this module be combined with student use of actual online catalogs of belts, sheaves, chains, and sprockets to specify part numbers and model numbers that can be specified for purchase.

- **Comments: V-Belts, U.S. Standards:** This module is pertinent to Section 7-4 in the text. Data entry and calculations are modeled after the method demonstrated in the book in Example Problem 7-1. Users are given options for selecting the belt size (3V, 5V, or 8V) and Figure 7-9 is used by the program to suggest a choice, which may be overridden by selecting another size. Selections for ‘Driver’ and ‘Driven machine’ types are identical to those used in Table 7-1 in the text. A design value for center distance is selected by the user after being given nominal minimum and maximum values. Then the user is presented with a set of optional combination of sheave sizes from which one must be chosen. That design is then evaluated and output data show the results. Iterations can be done easily by restarting the calculation and making modified selections.
- **Comments: Synchronous Belts:** This module approximates the methodology described in Section 7-5 of the text. Belts of the styles shown in Figure 7-18, both metric and U.S. sizes, are selected and analyzed by the program. Most data are shown in metric units for either style, although pull-down menus permit some features to be shown in U.S. units. The program is quite powerful, allowing multiple pulleys to be driven by one belt in serpentine arrangement. Most applications in this book will include two and only two pulleys. Data are input in tabular style and some practice may be required to become familiar with the details. It is recommended that the center of the driver pulley (No. 1) be positioned at $x = 0$, $y = 0$ on the coordinate system shown in the graphic aids. Then position the center of the driven pulley (No. 2; called a ‘jockey pulley’ in the module) at $x = \text{desired center distance}$ and $y = 0$. Entering 0° for the ‘Displacement angle’ will place the driven pulley to the right of the driver pulley. Enter 0 values for the ‘max effective ϕ ’ for each pulley and select ‘within’ for the ‘Location’ because the pulleys are positioned within the belt. For loads, it is normal to specify the power input to pulley 1 and the power output from pulley 2 to be equal and positive numbers. For U.S. data, select ‘hp US’ as the unit for power. Then leave the ‘Torque’ and ‘Tangential force’ entries as zero. The ‘Load Factor’ should be obtained from Table 7-1 (the same table as used for V-Belt drives). Then start the calculation. You will be presented screens offering choices for belt style, belt length, and belt width and you would normally select the nominal value offered for initial trials. Other values can be tried for subsequent trials until a satisfactory design is achieved.

- **Comments: Chain Drives – Roller Chains ISO 10823:** This module is pertinent to Section 7-7 of the text. It uses an ISO standard approach to the selection of chain drives that produces recommended chain sizes from ISO 606 as shown in Table 7-6 of the text. These sizes are identical to standard U.S. sizes for chain pitch as shown in the table. The performance analysis may differ slightly from the methods shown in the text. When using U.S. units for input data, ensure that Power is in ‘hp US’ and that units for other pertinent input and output data are expressed in the desired units, typically rpm for rotational speed and inches for dimensions. Selecting first the input page option: ‘Selection and calculation of one chain’ will result in a selection table being presented with options for different chain pitches and number of strands. Each design will list the rated power of the drive and the ‘Utilization’ (the value of the required corrected power to the rated power of the design, expressed as a percentage). The ‘Application factor to allow for the operating conditions, f_1 , is similar to the ‘Service factors’ shown in the book in Table 7-10. It is recommended that users select the option ‘Allow adjustment of factors f_1 and f_2 ’ (Yes). Then manually enter the service factor for f_1 and set $f_2 = 0$. This will match most closely to the methods used in the text. Common U.S. practice generally does not use a ‘Factor for number of teeth on drive sprocket’ (f_2).

Keys and Keyseats – Chapter 11

Module group: Shafts-Hub Connections: This module performs the calculations as described in Section 11-4 in the text, similar to Example Problem 11-1. Also included are calculations for the dimensioning variables Y , S , and T from Figure 11-2. Users enter the shaft diameter and either the torque or the combination of power and rotational speed. The yield strength of the key, shaft, and hub are entered or can be selected from a list of possible materials. After specifying the design factor to be used, the module produces the calculated results.

Rolling Contact Bearings – Chapter 14

Module group: Roller Bearings - Ball and Roller Bearings: The primary features of this module and its use are described in Section 14-11 of the text. The module provides access to a prominent manufacturer’s entire catalog for many types of bearings.

Plain Surface Bearings – Chapter 16

Module group: Journals – Plain Surface/Journals, US Standards: This module is patterned after Section 16-5 of the text – Design of Boundary-Lubricated Bearings. Problems of the types shown in Example Problems 16-1 and 16-2 are solved using this module. After entering data for radial load on the bearing, the rotational speed of the shaft, the selected trial value for shaft diameter, and a trial value of the L/D ratio, the program calculates the actual length, L , the bearing pressure, p , the surface speed, V , and the pV value, and the design value of pV .

(23calculated pV). It then searches a modest table of possible materials similar to that shown in Table 16-1 of the text for one that has a rated pV value closest to but more than the design pV value. The nominal diametral clearance for the bearing is also computed, using data shown in Figure 16-4 of the text.

- Please note that the label for the Diameter value on the Input page of this module uses the term, ‘Nominal minimum diameter of the journal, D_{min} ’. That is not the same as the minimum acceptable shaft diameter (based on shaft stress analysis). It should be the actual trial diameter for the shaft that is selected by the user and that must be greater than the minimum acceptable value based on strength.
- A recommended use for this module is as an aid in selecting commercially available sizes and materials for plain surface bearings from vendors such as those listed in the Internet sites for Chapter 16, particularly sites: 2 – Thomson Engineering & Polymers; 3 – Saint-Gobain Performance Plastics; 4 – GGB Bearing Technology; 5 – Graphite Metallizing Corporation; 6 – Beemer Precision, Inc.; and 7 – Bunting Bearings Corporation. These sites offer catalog data for their products and they list the design pV values for the various materials from which the bearings are made.
- For use of catalog data, users should select a preliminary value for the internal diameter and length for a particular bearing and make note of the design pV value for the selected material. Then compute the actual L/D ratio. Then enter the dimensions into the MDESIGN module (D and L/D), along with other given data for bearing load and rotational speed. The computed required “Design value of pV factor” should then be compared with the catalog-listed value for the selected material. The suggested material given on the module output page should be ignored. Iterations are easily and quickly done by trying other sizes until an optimum design is identified.

MACHINE ELEMENTS IN MECHANICAL DESIGN

Fifth Edition

Description of Spreadsheets Included with the Instructors Manual

Introduction

The Instructors Manual for this book contains a set of 26 computational aids that are keyed to the book. The files are written as Microsoft Excel spreadsheets.

Many of the spreadsheets appear in the text. Others were prepared to produce solutions for the Solutions Manual. The given spreadsheets include data and results from certain figures in the text, from certain example problems, or for certain problems from the end of chapters containing the analysis and design procedures featured in the programs.

The following sections give brief descriptions of each spreadsheet. Many are discussed in the text in more extensive detail. It is expected that you will verify all of the elements of each spreadsheet before using them for solutions to specific problems.

Using the Spreadsheets:

- *It is recommended that you maintain the given spreadsheets as they initially appear on the disk, considering them to be master copies.*
- *To use a program for solving other problems, call it up in Excel and use the "Save as" command to give it a different name.*
- *For instance, the original program called Column Analysis should be considered the master. Use "Save as" and call it, for example, Column Analysis – Working. Then use that version for general problem solving.*

You should study the concepts and the solution techniques for each type of problem before using the spreadsheets. You should work sample problems by hand first. Then enter the appropriate data into the spreadsheet to verify the solution. In most spreadsheets in the text, the data that need to be entered are identified by gray-shaded areas and by italic type.

Descriptions of Spreadsheets

The descriptions are given here in the order that the subjects for the spreadsheets are covered in the text.

Column Analysis: Chapter 6. Analyzes straight columns of uniform cross section to determine the critical buckling load and the allowable load. The spreadsheet shows results for Example Problem 6-1. U.S. Customary units are used. A description is given in Section 6-8. The process is essentially the same as that shown in the flow chart of Figure 6-4. Note that a short macro program in Visual Basic is used to decide whether the column is *long* (Euler) or *short* (J. B. Johnson) and to complete the calculation of the critical buckling load. Be sure that your Excel program enables macros.

Column Analysis SI: Chapter 6. Same as **Column Analysis:** except SI units are used. The solution to Example Problem 6-2 is given as an example for data entry.

Circular Column Analysis: Chapter 6. Special version of **Column Analysis** in which the geometric properties of a column with a solid circular cross section are computed when the diameter is input. The spreadsheet can be used as an iterative design tool to determine the required diameter of a column with a circular cross section to carry a given load. See Figure 6-14.

Crooked Column Analysis: Chapter 6. Section 6-11. Analyzes the allowable load on a column of constant cross section with a given amount of crookedness. Data from Example Problem 6-4 are used as shown in Figure 6-16 on page 252.

Eccentric Column Analysis: Chapter 6. Section 6-12. Computes the required yield strength of the material and the resulting maximum deflection of the middle of a column that is loaded eccentrically. Data from Example Problem 6-6 are used as shown in Figure 6-18.

Chain Drive Design: Chapter 7. Design of roller chain drives as described in Section 7-6. User must obtain rated power data from Tables 7-7, 7-8, or 7-9 to specify a suitable chain number and number of teeth in the smaller sprocket. A service factor must be selected from Table 7-10 in the text. Data from Example Problem 7-4 are shown in the master spreadsheet.

Gear Geometry: Chapter 8. Computes the geometric features of spur and helical gears using the relationships in Sections 8-4 and 8-6. Can be used for Problems 1-9 and 41-44.

Contact Ratio-Spur Gears: Chapter 8. Computes the contact ratio for spur gears using the procedure shown in Section 8-4.

Bevel Gear Geometry: Chapter 8. Computes the geometric features of straight bevel gears using the formulas listed in Table 8-8 in Section 8-7 and illustrated in Example Problem 8-3. Two identical programs are shown side-by-side. One shows the results of Example Problem 8-3 and the other can be used to solve any given problem.

Wormgearing Geometry, C, VR: Chapter 8. Computes essential geometric features of a worm and wormgear, the center distance (C) between their shafts, and the velocity ratio, VR. Uses procedure from Section 8-9 as illustrated in Example Problem 8-4. The spreadsheet was used to complete Problems 52-57 at the end of the chapter.

Gears VR Design: Chapter 8. Aids in the specification of the number of teeth in a pinion and gear to produce a specified velocity ratio. Uses a procedure similar to that shown in Section 8-11 and illustrated in Table 8-10. An integer is entered for the number of teeth in the pinion. The program computes the required approximate number of teeth in the gear to produce the given velocity ratio. The user then enters an integer for the actual number of gear teeth. The program identifies the combination of numbers of teeth that produces the minimum differential between the desired ratio and the actual ratio. The spreadsheet was used to complete Problems 62-65 at the end of the chapter.

Spur Gear Forces: Chapter 9. Computes the tangential, radial, and normal forces on spur gear teeth of a given design transmitting a given power at a given pinion speed. It uses the method of Section 9-3. The spreadsheet was used to complete Problems 1-6 at the end of Chapter 9. The results for Problems 1 and 2 are shown in the master.

Spur Gears-Design-U.S.: Chapter 9. Performs a complete design analysis for a pair of spur gears, including the essential geometry, tangential force, required bending stress number, and required contact stress number. All modifying factors for stress calculations as described in Sections 9-8 to 9-11 are included. The data from Example Problem 9-4 are shown in the given spreadsheet as illustrated in Figure 9-25. An extensive discussion of the spreadsheet is given in Section 9-13. A feature of the spreadsheet is the computation of the required hardness (HB) for through-hardened Grade 1 steel using the equations in Figures 9-11 and 9-12. The user can then specify suitable materials and list them at the bottom of the spreadsheet.

Geometry Factor-*I*-Pitting: Chapter 9. Computes the value of the geometry factor, *I*, used in the calculation of contact stress for spur gears in Equation 9-23. Program uses the algorithm from Appendix A18.

Spur Gears-Design-U.S.-With *I*: Chapter 9. Same as **Spur Gears-Design** except the geometry factor, *I*, is computed within the program instead of being input by the user. The program **Geometry Factor-*I*-Pitting** is integrated within **Spur Gears-Design**. One additional input value is needed for the pressure angle, ϕ .

Spur Gears-Design-SI: Chapter 9. Similar to **Spur Gears-Design:** except SI metric data are used as described in Section 9-13 and illustrated in Example Problem 9-5. Data from Example Problem 9-5 are used in the given spreadsheet.

Spur Gears-Capacity-U.S.: Chapter 9. Section 9-15. Determines the power transmitting capacity of a given set of spur gears considering both bending strength and pitting resistance. The user must input the allowable bending stress and allowable contact stress based on the material specified for the pinion and the gear using Figures 9-11 and 9-12 and Table 9-5. The spreadsheet includes the computation of the required bending stress number, s_{ab} , and contact stress number, s_{ac} , based on user-entered hardness (HB) for through-hardened Grade 1 steel using the equations in Figures 9-11 and 9-12. The user must transcribe these values into the spreadsheet if, in fact, this kind of material is specified.

Plastic Gears- Design: Chapter 9. Completes the design of plastic gears using the procedure from Section 9-16. Data are shown for Example Problem 9-7.

Helical Gears-Design: Chapter 10. Computes the forces on helical gear teeth as described in Section 10-2 and illustrated in Example Problem 10-1. Completes the design analysis for a pair of helical gears as described in Sections 10-3 to 10-5 and illustrated in Example Problem 10-3. Used for the solutions to Problems 1-11 at the end of Chapter 10.

Helical Gears-Capacity: Chapter 10. Similar to **Spur Gears-Capacity:** with modifications for the special geometry of helical gear teeth. Used for the solutions to Problems 12 and 13 at the end of Chapter 10. The user must input the allowable bending stress and allowable contact stress based on the material specified for the pinion and the gear using Figures 9-11 and 9-12 and Table 9-5. The spreadsheet includes the computation of the required bending stress number, s_{ab} , and contact stress number, s_{ac} , based on user-entered hardness (HB) for through-hardened Grade 1 steel using the equations in Figures 9-11 and 9-12. The user must transcribe these values into the spreadsheet if, in fact, this kind of material is specified.

Bevel Gears – Design: Chapter 10. Computes forces and stresses on bevel gears using the methods shown in Section 10-9.

Wormgearing – Design: Computes worm and wormgear geometry values, forces, and stresses for wormgearing, using methods and data from Chapter 8 (Section 8-9) and Chapter 10 (Sections 10-10, 10-11, and 10-12). The master spreadsheet uses data from Example Problems 8-4, 10-9, and 10-10.

Keyseat Data: Chapter 11. Computes the data required to dimension keyseats and keyways on shaft drawings according to the information in Figure 11-2.

Shaft Design: Chapter 12. Computes the minimum acceptable diameter for shafts using Equation 12-24 when both bending and torsion are present and Equation 12-16 when only vertical shearing stress is present. Requires prior analysis for torques, forces, bending moments, pertinent material strengths, modifying factors on material strength, and stress concentration factor. The program is typically applied at several selected sections of the shaft as illustrated in Design Example 12-1 in Section 12-6. If the location being analyzed has a retaining ring installed, the computed minimum shaft diameter is considered to be for the base of the ring groove. The spreadsheet computes the nominal full shaft diameter by applying a factor of 1.06 as described at the end of Section 12-4. The data used in the master spreadsheet are for one location on the shaft in Design Example 12-1 as illustrated in Figure 12-19 in Section 12-9 where the spreadsheet and its use are described.

Force Fits: Chapter 13, Section 13-8. Stresses for Force Fits. Computes the pressure at the interface between mating members assembled with an interference fit (See Section 13-6.) Also computes the resulting stresses and deformations for the mating members using the procedure in Section 13-8. Data from Example Problem 13-2 are shown in the example.

Spring Design-Method 1: Chapter 18, Section 18-6. The given spreadsheet uses data and the method from Example Problem 18-2 to design a safe helical compression spring for a given loading and to fit given geometrical limitations. See Figure 18-16 and the accompanying discussion.

Spring Design-Method 2: Chapter 19. Similar to **Spring Design-Method 1** without the restriction of designing to a set of geometrical limitations. See Example Problem 18-3, Figure 18-17, and the accompanying discussion.

CHAPTER 1

THE NATURE OF MECHANICAL DESIGN

Problems 1 - 14 require the specification of functions and design requirements for design projects and have no unique solution.

15. $D = 1.75 \text{ in.} \times 25.4 \text{ mm/in.} = \underline{44.5 \text{ mm}}$

16. $L = 46 \text{ ft} \times 0.3048 \text{ m/ft} = \underline{14.0 \text{ m}}$

17. $T = 12,550 \text{ lb-in.} \times 0.1130 \text{ N-m/lb-in.} = \underline{1418 \text{ N-mm}}$

18. $A = 4.12 \text{ in}^2 \times 645.2 \text{ mm}^2/\text{in}^2 = \underline{2658 \text{ mm}^2}$

19. $Z = 14.8 \text{ in}^3 \times 1.639 \times 10^6 \text{ mm}^3/\text{in}^3 = \underline{2.43 \times 10^5 \text{ mm}^3}$

20. $I = 88.0 \text{ in}^4 \times 4.162 \times 10^5 \text{ mm}^4/\text{in}^4 = \underline{3.66 \times 10^9 \text{ mm}^4}$

21. GIVEN $A_{min} = 750 \text{ mm}^2$; IN U.S. UNITS: $A_{min} = 1.162 \text{ in}^2$

APP. 15-1: $L_2 \times 2 \times \frac{3}{8}, A = 1.36 \text{ in}^2 = 890 \text{ mm}^2$

APP 15-3: ANGLES 50 X 100 X 6 AND 75 X 75 X 5 HAVE $A = 864 \text{ mm}^2$

22. $P = 7.5 \text{ hp} \times 745.7 \text{ W/hp} = 5.59 \times 10^3 \text{ W} = \underline{5.59 \text{ kW}}$

23. $S_w = 127 \text{ ksi} \times 6.895 \text{ MPa/ksi} = \underline{876 \text{ MPa}}$

24. LET $D = 0.035 \text{ m}; L = 0.675 \text{ m}; \text{VOLUME} = V = A \times L = (\pi D^2/4) \times L$

$$V = \frac{\pi (0.035 \text{ m})^2}{4} \times 0.675 \text{ m} = 6.49 \times 10^{-4} \text{ m}^3$$

$$\text{MASS} = \text{DENSITY} \times V = 7680 \text{ kg/m}^3 \times 6.49 \times 10^{-4} \text{ m}^3 = 4.98 \text{ kg}$$

$$\text{WEIGHT} = m \times g = 4.98 \text{ kg} \times 9.81 \text{ m/s}^2 = 48.9 \text{ kg} \cdot \text{m/s}^2 = \underline{48.9 \text{ N}}$$

25. $T = 180 \text{ LB-IN} \times 0.1130 \text{ N-m/LB-IN} = \underline{20.3 \text{ N-m}}$

$$\theta = 35^\circ \times \pi \text{ RAD}/180^\circ = \underline{0.611 \text{ RAD.}}$$

$$\text{SCALE} = T/\theta = 180 \text{ LB-IN}/35^\circ = \underline{5.14 \text{ LB-IN/DEGREE}}$$

$$\text{SCALE} = T/\theta = 20.3 \text{ N-m}/0.611 \text{ RAD.} = \underline{33.3 \text{ N-m/RAD.}}$$

26. ENERGY = POWER \times TIME

$$E = 12.5 \text{ hp} \times \frac{16 \text{ h}}{\text{DAY}} \times \frac{5 \text{ DAYS}}{\text{WEEK}} \times \frac{52 \text{ WKS}}{\text{YEAR}} \times \frac{550 \text{ FT-LB}}{\text{s-hp}} \times \frac{3600 \text{ s}}{\text{h}}$$

$$E = \underline{1.03 \times 10^9 \text{ FT-LB/YEAR}}$$

$$E = 1.03 \times 10^9 \frac{\text{FT-LB}}{\text{YEAR}} \times \frac{1.356 \text{ J}}{\text{FT-LB}} \times \frac{1.0 \text{ N-m}}{\text{J}} \times \frac{1 \text{ W}}{\text{N-m/s}} \times \frac{1 \text{ h}}{3600 \text{ s}}$$

$$E = 38.8 \times 10^6 \text{ W-h/YEAR} = \underline{38.8 \text{ MW-h/YEAR}}$$

27.

$$\text{VISCOSITY } \mu = 3.75 \text{ REYN} \times \frac{1.0 \text{ LB-S}}{\text{IN}^2 \cdot \text{REYN}} \times \frac{144 \text{ IN}^2}{\text{FT}^2} = \underline{540 \frac{\text{LB-S}}{\text{FT}^2}}$$

$$\mu = 3.75 \frac{\text{LB-S}}{\text{IN}^2} \times \frac{4,448 \text{ N}}{\text{LB}} \times \frac{1.0 \text{ IN}^2}{645.2 \text{ MM}^2} \times \frac{10^6 \text{ MM}^2}{\text{m}^2} = \underline{25.9 \times 10^3 \frac{\text{N-S}}{\text{m}^2}}$$

28.

$$\text{LIFE} = \frac{1750 \text{ REV}}{\text{MIN}} \times \frac{24 \text{ h}}{\text{DAY}} \times \frac{60 \text{ MIN.}}{\text{h}} \times \frac{365 \text{ DAYS}}{\text{YEAR}} \times 5 \text{ YEARS}$$

$$\text{LIFE} = \underline{4.60 \times 10^9 \text{ REVOLUTIONS}}$$

CHAPTER 2

MATERIALS IN MECHANICAL DESIGN

1. Ultimate tensile strength is the apparent stress at the peak of the stress-strain curve.
2. Yield point is the value of the apparent stress from the stress-strain curve at which there is a large increase in strain with no increase in stress. It is the point where the stress-strain curve exhibits a horizontal slope.
3. Yield strength is the apparent stress from the stress-strain curve at which there is a large increase in strain with little increase in stress for materials that do not exhibit a yield point. The offset method is used by drawing a line parallel to the straight part of the stress-strain curve through a value of 0.2% on the strain axis.
4. Many low alloy steels exhibit a yield point.
5. The proportional limit is the apparent stress on the stress-strain curve at which the curve deviates from a straight line. At this value, the material is usually still elastic. The elastic limit is the apparent stress at which the material is deformed plastically and will not return to its original size and shape.
6. Hooke's law applies to that portion of the stress-strain curve that is a straight line for which stress is proportional to strain.
7. The modulus of elasticity is a measure of the stiffness of a material.
- 8.. The percent elongation is a measure of the ductility of a material.
9. The material is not ductile. Materials having a percent elongation greater than 5% are considered to be ductile.
10. Poisson's ratio is the ratio of the lateral strain in a material to the axial strain when subjected to a tensile load.
11. From EQ. 2-5 $G = E/[2(1+\nu)] = (114 \text{ GPa})/[2(1+0.33)]$
 $G = 42.9 \text{ GPa}$

12. Hardness = 52.8 HRC (Approximate; Appendix 17)
13. Tensile strength = 235 ksi (Approximate; Appendix 17)
- 14.-17. Errors in given statements:
 14. A hardness of HB 750 is extremely hard, characteristic of the hardest steels in the as-quenched or surface hardened condition. Appendix 3 shows annealed steels to have hardness values in the approximate range of HB 120 to 230.
 15. Hardness on the HRB scale is normally limited to HRB 100.
 16. Hardness on the HRC scale is normally no lower than HRC 20.
 17. The relationship between hardness and tensile strength is only valid for steels.
 18. Charpy and Izod tests measure impact strength.
 19. Iron and carbon. Other elements are often present.
 20. In addition to iron and carbon SAE 4340 steel contains nickel, chromium, and molybdenum. (Table 2-8)
 21. Approximately 0.40% carbon in SAE 4340 steel.
 22. Low-carbon: Less than 0.3%
Medium-carbon: 0.30% to 0.50%
High-carbon: 0.50% to 0.95%
 23. Typically a bearing steel contains 1.0% carbon.
 24. Lead is added to SAE 12L13 steel to improve machinability.
 25. Shafts are often made from SAE 1040, 4140, 4640, 5150, 6150, and 8650 steels. (Table 2-9)
 26. Gears are often made from SAE 1040, 4140, 4340, 4640, 5150, 6150, and 8650 steels. (Table 2-9)
 27. The blades of a post hole digger should have good wear resistance, high strength, and good ductility. SAE 1080 steel is a reasonable choice.
 28. SAE 5160 OQT 1000 is a high-carbon, chromium steel, containing approximately 0.60% carbon and 0.80% chromium. It was heat treated by heating above its upper critical temperature, quenched in oil, and then tempered at 1000 degrees Fahrenheit. It has fairly high strength ($s_y = 151$ ksi or 1040 MPa) and good ductility (14% elongation).

29. In general, a high hardness with good ductility are desirable for machine parts and tools subjected to impact loads as seen by a shovel. A hardness of HRC 40 corresponds to approximately HB 375 and is considered moderately hard. While this is a good level, even a higher value up to HRC 50 (HB 475) would be better, provided ductility is fairly high, say about 15% elongation. Appendix 3 shows some forms of oil-quenched SAE 1040 and none listed have sufficiently high hardness. Appendix 4-1 shows the same material quenched in water and tempered. SAE 1040 WQT 700 has a hardness of HB 401 (HRC 43) with approximately 20% elongation and a yield point of 92 ksi.
30. Through hardening involves heating the entire part followed by quenching to achieve the hardened condition. Except for some variation in thick sections, the part is hardened throughout. But no chemical composition changes occur. In carburizing, the chemical composition of the surface is changed by the infusion of carbon. Thus, carburizing results in a hard surface while the core is softer.
31. Induction hardening is a heat treating process in which the area to be hardened is subjected to a high-frequency electric current created by a coil, inducing current flow near the surface of the part and causing local heating. After sufficient time to bring the surface to a temperature above the upper critical temperature of the material, the part is quenched to harden the surface.
32. Some carburizing grades of steels are SAE 1015, 1020, 1022, 1117, 1118, 4118, 4320, 4620, 4820, 8620 and 9310. The carbon content ranges from 0.10% to 0.20%. App. A-5.
33. The AISI 200 and 300 series of stainless steels are nonmagnetic.
34. Chromium gives stainless steels good corrosion resistance.
35. ASTM A992 structural steel is used for most wide-flange beams.
36. HSLA structural steels are high-strength, low-alloy steels having yield strengths in the range of 42 - 100 ksi (290 - 700 MPa).
37. Three types of cast iron are gray iron, ductile iron, and malleable iron.
38. ASTM A48 , Grade 30 is a gray iron with a tensile strength of 30 ksi (207 MPa); no yield strength; less than 1% elongation (brittle); modulus of elasticity (stiffness) of 169×10^6 psi (117 GPa).

Problem 38. (continued)

ASTM A536. Grade 100-70-03 is a ductile iron with a tensile strength of 100 ksi (689 MPa); a yield strength of 70 ksi (483 MPa); 3% elongation (brittle); modulus of elasticity (stiffness) of 24×10^6 psi (165 GPa).

ASTM A47. Grade 325/D is a malleable iron with a tensile strength of 50 ksi (345 MPa); a yield strength of 32.5 ksi (224 MPa); 10% elongation (ductile); modulus of elasticity (stiffness) of 25×10^6 psi (172 GPa).

ASTM A220, Grade 70003 is a malleable iron with a tensile strength of 85 ksi (586 MPa); a yield strength of 70 ksi (483 MPa); 3% elongation (brittle); modulus of elasticity (stiffness) of 26×10^6 psi (179 GPa).

39. Powdered metals are preformed in a die under high pressure and sintered at a high temperature to fuse the particles. Re-pressing after sintering is sometimes used.
40. Parts made from Zamak 3 zinc casting alloy typically have good dimensional accuracy and smooth surfaces, a tensile strength of approximately 41 Ksi (283 MPa), a yield strength of 32 Ksi (221 MPa), 10% elongation, and a modulus of elasticity of 12.4×10^6 psi (85 GPa). (Appendix 10)
41. Type D tool steels are typically used for stamping dies, punches, and gages. (Table 2-11)
42. The suffix O on aluminum 6061-O indicates the annealed condition.
43. The suffix H on aluminum 3003-H14 indicates that it was strain hardened.
44. The suffix T on aluminum 6061-T6 indicates that it was heat treated.
45. Aluminum 7178 -T6 has the highest strength; tensile strength = 88 ksi (607 MPa); yield strength = 78 ksi (538 MPa).
46. Aluminum alloy 6061 is one of the most versatile.
47. Three typical uses of titanium alloys are aerospace structures, chemical processing equipment, and marine hardware.
48. Bronze is an alloy of copper with tin, aluminum, lead, phosphorus, nickel, zinc, manganese, or silicon.

49. Bronze C86200 is a manganese bronze casting alloy with a tensile strength of 95 ksi (655MPa); yield strength of 48 ksi (331 MPa); 20% elongation (ductile); modulus of elasticity of 15×10^6 psi (103 GPa).
50. Bronze is used for gears and bearings.
51. Thermosetting plastics undergo a chemical change during forming resulting in a structure of cross-linked molecules. The process cannot be reversed or repeated. Thermoplastic materials can be formed repeatedly by reheating because the molecular structure is essentially unchanged during processing.
52. a) Gears: Nylon, polycarbonate, acetal, polyurethane elastomer, phenolic. b) Helmets: ABS and polycarbonates. c) Transparent shield: Acrylic. d) Structural housing: PET, ABS, polycarbonate, acrylic, PVC, phenolic, polyester/glass composite. e) Pipe: ABS, PVC. f) Wheels: Polyurethane elastomer. g) Switch parts: polyimide, phenolic, PET.
53. Designers of parts to be made from composite materials can control 1) base resin, 2) reinforcing fibers, 3) amount of fibers, 4) orientation of fibers, 5) number of layers, 6) overall thickness, 7) orientation of layers, 8) combinations of types of materials.
54. Composite materials are comprised of two or more different materials, typically a resin reinforced by fibers.
55. Resins used for composites include polyesters, epoxies, polyimides, PHENOLICS (ALL THERMOSETS), THERMO PLASTICS: PE, PA, PEEK, PPS, PVC.
56. Reinforcing fibers used for composites are glass, boron, aramid, and carbon/graphite.
57. Sporting equipment is made from glass/epoxy, boron/epoxy, and graphite/epoxy composites.
58. Aerospace structures are made from glass/epoxy, boron/epoxy, graphite/epoxy, and aramid/epoxy composites.
59. Sheet molding compound is typically a glass/polyester composite.
60. SMC's are used for auto and truck body panels and large housings.
61. Reinforcing fibers are produced as continuous filaments, chopped fibers, roving, fabric, yarn, and mats.

62. Wet processing of composites involves the layup of fabric reinforcing sheets on a form, saturation of the sheets with the resin, and curing under heat and pressure.
63. Preimpregnated composite materials are produced with the resin already on the fibers in a convenient form, called a prepreg. The prepreg is layered onto the form and cured.
64. SMC's are preimpregnated fabric sheets formed in a mold and cured simultaneously under heat and pressure.
65. Pultrusion is a process of coating the fiber reinforcement as it is pulled through a heated die to produce a continuous form such as tubing, structural shapes, rod, and hat sections used to stiffen aircraft structures.
66. In the filament winding process, continuous filaments are placed around a mandrel in a controlled pattern and then cured. The process is used for pipe, pressure vessels, rocket motor cases, containers and enclosures.
67. Specific strength is the ratio of the strength of a material to its specific weight.
68. Specific stiffness is the ratio of the modulus of elasticity of a material to its specific weight.
69. Many composites have significantly higher values of specific strength and specific stiffness than metals.

70 - 73 refer to Figure 2-23 and Table 2-17.

General conclusions from Questions 70 - 73: The specific strengths of the metals listed range from 0.194×10^6 to 1.00×10^6 in, approximately a factor of 5.0. The specific stiffnesses are very nearly equal for all metals listed, approximately 1.0×10^8 in. The specific strengths of the composites listed range 1.87 to 4.8×10^6 in, much higher than any of the metals. Glass/epoxy has a specific stiffness about 2/3 that of the metals. The other composites listed range from 2.2 to 8.3 times as stiff as the metals.

See Section 2-17 for answers to Questions 74 to 100.

Supplementary Problems – Chapter 2

1. Poisson's ratio: a) Carbon steel – 0.29; c) Lead – 0.43; e) Concrete – 0.10 to 0.25
2. See Section 2-2, subsection: Flexural Strength and Modulus, and Figure 2-5.
3. Erosive, abrasive, adhesive, fretting, surface fatigue
4. From Table 2-6: 14 alloys listed, Examples: ASTM A36, SAE 1018 HR or CD, SAE 1045 HR or CD, SAE 8620 CD.
5. From Table 2-6: SAE 304 and SAE 316
6. From Table 2-6: Six alloys listed, Examples: 2024-T4, 3003-H14, 6061-T6, 6063-T6
7. From Section 2-3: ASTM International, AISI, SAE
8. From Section 2-3: Aluminum Association
9. From Table 2-7: a) DIN 42CrMo4 or W-1.7225; b) BS 708A42; c) EN 42CrMo4; d) GB ML42CrMo4; e) JIS SCM 440H
10. From Table 2-7: a) DIN C45 or W-1.0503; b) BS 060A47; c) EN C45; d) GB 699-45; e) JIS S45C
11. From Table 2-7: a) DIN X6Cr17 or W-1.4016; b) BS 430S17; c) EN X6Cr17; d) GB ML1Cr17; e) JIS SUS430
12. From Table 2-7: a) DIN AlZnMgCu1.5 or W-3.4365; b) BS L.95, L.96; c) EN AlZn6MgCu
13. Water, brine, mineral oil, water-soluble polyalkylene glycol (PAG)
14. From Section 2-6: Fine steel or cast iron shot is projected at high velocity on critical surfaces to produce residual compressive stress that tends to improve the fatigue strength.
15. From Table 2-10: ASTM A27/A27M; A915/A915M; A128/A128M; A148/A148M
16. From Table 2-10: ASTM A757; ASTM A351; ASTM A216; ASTM A389
17. Carbidic austempered ductile iron – used for: railroad rolling stock, earthmoving equipment, agricultural machinery, crushers
18. From Section 2-10: White iron is made by rapidly chilling a casting of gray iron or ductile iron during solidification. ASTM Standard A532 describes the process. Used to improve wear resistance for ball mills, crushers, mixing equipment, and material handling devices.
19. From Section 2-11: Powders are pressed to their basic form and then heated to sinter the powder particles into a strong solid.
20. From Section 2-11: Powders are compressed by a flexible membrane in a hermetic chamber to produce a high density; may be done cold or at elevated temperatures.
21. From Section 2-11: Metal powders are fed into an injection molding machine to form a green part that is then sintered to complete the solidification and bonding processes.
22. From Section 2-11: Metal powders are first pressed and sintered, then forged in a closed-die press to achieve final form and properties.
23. From Table 2-12: Carbon steel F-0008-HT, $s_u = 85 \text{ ksi}$ (590 MPa);

Low-alloy steel FL-4405-HT, $s_u = 160$ ksi (1100 MPa);

Diffusion-alloyed steel FD-0205-HT, $s_u = 130$ ksi (900 MPa);

Sinter-hardened steel FLC-4608-HT, $s_u = 100$ ksi (690 MPa)

24. From Table 2-12: a) Nickel silver – CNZ-1818; $s_u = 20$ ksi (118 MPa)
 - b) Bronze – CTG-1001; (no strength listed; used for bearings)
 - c) Copper – C-0000; No strength listed; used for electrical applications
 - d) Aluminum - $s_u = 32$ ksi (221 MPa)
25. From Section 2-11: Projected surface area less than 50 in² (32 000 mm²)
26. From Section 2-12: Aluminum casting alloys: 202, 222, 319, 360, 413, 444, 512, 535, 712, 771, 850, 852. Others available.
27. From Section 2-12: Aluminum 2014, 2024, 6061
28. From Section 2-13: Zinc alloy No. 3 or Zamak 3.
29. From Section 2-13 and Appendix A10-1: Zinc ZA-8, $s_u = 54$ ksi (374 MPa)
ZA-12, $s_u = 59$ ksi (404 MPa); ZA-27, $s_u = 61$ ksi (421 MPa)
30. From Section 2-14: Nickel-based alloys have good corrosion resistance and retain good levels of strength at high temperatures.
31. From Section 2-15: a) Bearing bronze C93200I; b) Phosphor bronze C54400;
 - c) Muntz metal C37000; d) Manganese bronze C86200;
 - e) Copper-nickel-zinc alloy C96200; f) Manganese bronze C67500
32. From Section 2-15: H-numbers indicate the degree of hardening by strain hardening methods; a) H04 – Full hard; b) H02 – ½ hard; c) H01 – 1/8 hard; d) H08 – Spring hard
33. From Section 2-15: TD temper indicates – solution heat treated and cold worked
34. From Section 2-15 and Figure 2-18: As the percent cold reduction increases, tensile and yield strengths increase and ductility as indicated by percent elongation decreases.
10% cold work: $s_u = 133$ ksi (917 MPa), $s_y = 121$ ksi (834 MPa), 17% elongation
40% cold work: $s_u = 154$ ksi (1062 MPa), $s_y = 142$ ksi (979 MPa), 1% elongation
35. From Section 2-18: Metals, polymers, ceramics, glasses, elastomers, hybrids
36. From Section 2-18: Foams, sandwich structures, honeycomb structures
37. From Fig. 2-31: d) Metals, b) ceramics, g) composites, c) polymers, a) wood,
h) rubbers/elastomers, f) foams
38. From Fig. 2-32: b) ceramics, d) metals, g) composites, a) wood, c) polymers, f) foams,
h) elastomers
39. From Figure 3-32: (lightest to heaviest) e) foams, a) wood, h) elastomers, g) composites,
d and b) Metals and ceramics (about equal)

CHAPTER 3

STRESS AND DEFORMATION ANALYSIS

Direct Tension and Compression

1. $\sigma = F/A ; A = \pi (18^2 - 12^2)/4 = 191.4 \text{ mm}^2$

$$\sigma = 4500 \text{ N} / 191.4 \text{ mm}^2 = 31.8 \text{ N/mm}^2 = \underline{\underline{31.8 \text{ MPa}}}$$

$$\delta = \frac{PL}{EA} = \frac{(4500 \text{ N})(750 \text{ mm})}{(207 \times 10^9 \text{ N/mm}^2)(191.4 \text{ mm}^2)} \times \frac{10^6 \text{ mm}^2}{\text{m}^2} = \underline{\underline{0.12 \text{ mm}}}$$

2. $\sigma = F/A = 3500 \text{ N}/(\pi (10)^2/4) \text{ mm}^2 = \underline{\underline{44.6 \text{ MPa}}}$

3. $\sigma = F/A = 20 \times 10^3 \text{ N}/(0.30) \text{ mm}^2 = \underline{\underline{66.7 \text{ MPa}}}$

4. $\sigma = F/A = 860 \text{ LB}/(0.40 \text{ in})^2 = \underline{\underline{5375 \text{ psi}}}$

5. $\sigma = F/A = 1900 \text{ LB}/\pi (0.375 \text{ in})^2/4 = \underline{\underline{17,200 \text{ psi}}}$

6. $\sigma = P/A ; A = (12 \text{ mm})^2 = 144 \text{ mm}^2 ; \sigma = \frac{5000 \text{ N}}{144 \text{ mm}^2} = \underline{\underline{34.7 \text{ MPa}}}$

$$\delta = \frac{PL}{EA} = \frac{(5000 \text{ N})(1650 \text{ mm})}{(E \text{ N/mm}^2)(144 \text{ mm}^2)} = \frac{57292}{E} \text{ mm}$$
 (All)

a) AISI 1020 ; $E = 207 \text{ GPa} = 207 \times 10^3 \text{ N/mm}^2 ; \delta = \underline{\underline{0.277 \text{ mm}}}$

b) AISI 8650 ; $E = 207 \text{ GPa} ; \delta = \underline{\underline{0.277 \text{ mm}}}$

c) DUCTILE IRON ; $E = 165 \text{ GPa} ; \delta = \underline{\underline{0.347 \text{ mm}}}$

d) ALUMINUM 6061-T6 ; $E = 69 \text{ GPa} ; \delta = \underline{\underline{0.830 \text{ mm}}}$

e) TITANIUM Ti-6AL-4V ; $E = 114 \text{ GPa} ; \delta = \underline{\underline{0.503 \text{ mm}}}$

f) PVC ; $E = 2410 \text{ MPa} = 2070 \text{ N/mm}^2 ; \delta = \underline{\underline{277 \text{ mm}}}$

g) PHENOLIC ; $E = 2580 \text{ MPa} ; \delta = \underline{\underline{7.56 \text{ mm}}}$

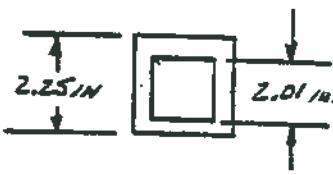

NOTE: STRESS IS CLOSE TO THE ULTIMATE FOR f AND g.

7. $\delta = PL/\sigma A ; P = \frac{\delta EA}{L}$

$$A = (2.25^2 - 2.01^2) \text{ in}^2 = 1.02 \text{ in}^2$$

$$\rho = \frac{(0.004 \text{ in})(10 \times 10^6 \text{ lb/in}^2)(1.02 \text{ in}^2)}{16.0 \text{ in.}} = 2556 \text{ lb}$$

$$\sigma = P/A = 2556 \text{ lb}/1.02 \text{ in}^2 = 2506 \text{ psi}$$

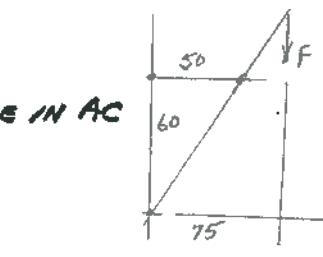

8. $\Sigma M_B = 0 \Rightarrow 2500(75) - F_c(60)$

$$F_c = 2500 \left(\frac{75}{60}\right) = 3125 \text{ lb} = \text{TENSILE FORCE IN AC}$$

$$\sigma = \frac{P}{A} = \frac{3125 \text{ lb}}{(0.50)(3.50) \text{ in}^2} = 595 \text{ psi}$$

9. $2 F_R \sin \theta = 1500 \text{ lb}$

$$F_R = \frac{1500}{2 \sin(45^\circ)} = 1061 \text{ lb}$$

10. $\sigma = P/A ; \text{REQ'D. } A = P/\sigma_{\text{allow}}$

$$A = \frac{1061 \text{ lb}}{18000 \text{ lb/in}^2} = 0.0589 \text{ in}^2 = \pi D^2/4$$

$$D = \sqrt{\frac{4A}{\pi}} = \sqrt{\frac{4(0.0589)}{\pi}} = 0.274 \text{ in. MINIMUM}$$

11. $\theta = 15^\circ ; F_R = \frac{1500 \text{ lb}}{2 \sin \theta} = \frac{1500 \text{ lb}}{2 \sin(15)} = 2898 \text{ lb}$

$$A = \frac{2898}{18000} = 0.161 \text{ in}^2 ; D = \sqrt{\frac{4(0.161)}{\pi}} = 0.453 \text{ in}$$

12.

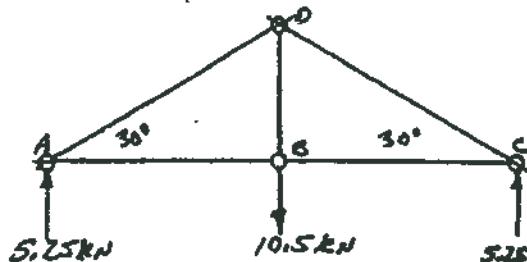

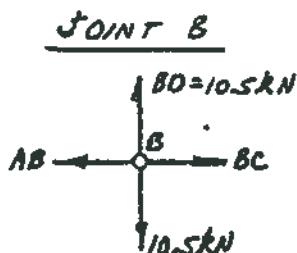

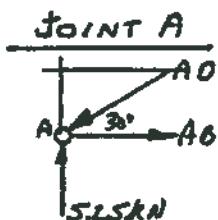

FIG. P3-12

$$\begin{aligned}AD \sin 30^\circ &= 5.25 \text{ kN} \\AD &= 10.5 \text{ kN} = CD \\AB &= AD \cos 30^\circ = 9.09 \text{ kN} = BC\end{aligned}$$

STRESSES:

BECAUSE $F_o \approx F_i$, THE DESIGN OF THE INVERTED T-SECTION USES THE MATERIAL VERY EFFICIENTLY.

CHAPTER 4

COMBINED STRESSES AND MOHR'S CIRCLE

NOTE: The solutions to Chapter 4 problems 1 – 30 are shown on the following pages as images of the output from the MDESIGN – MOTT software that is included in the text. Each problem produces a solution in line with the procedure shown for manual solution in Section 4-4 in Chapter 4 of the text and as shown in the four Example Problems in Section 4-5 of the text. Problem 4-1 is shown worked out in manual form below and the MDESIGN – MOTT solution is shown on the following page. Solutions for all other problems are shown only as the results from the MDESIGN – MOTT solutions. Note that in the MDESIGN-MOTT output, the graphic view of Mohr's circle and the stress elements show the stress values only in psi.

Shear stress	τ	=	150.021	kPa

Note: Both principle stresses have the same sign (both are tensile or both are compressive).

User must consider the resulting three-dimensional case.

Due to compound angles, elements as calculated are not applicable.

31.

USE $D = 0.500 \text{ IN}$ FOR SHAFT ABC. STRESS ELEMENT ON BOTTOM.

FROM FIG. 3-23: $M_B = 252 \text{ LB-IN}$; $T_B = 300 \text{ LB-IN}$.

$$Z = \pi D^3/32 = \pi (0.500)^3/32 = 0.01227 \text{ IN}^3$$

$$\sigma_B = \frac{M_B}{Z} = \frac{252 \text{ LB-IN}}{0.01227 \text{ IN}^3} = 20538 \text{ psi} = \sigma_x$$

$$Z_p = \pi D^3/16 = 22 = 0.02454 \text{ IN}^3$$

$$T_B = \frac{T_B}{Z_p} = \frac{300 \text{ LB-IN}}{0.02454 \text{ IN}^3} = 12225 \text{ psi}$$

$$R = T_{MAX} = \sqrt{10269^2 + 12225^2} = 15966 \text{ psi}$$

$$\sigma_i = 10269 + 15966 = 26235 \text{ psi}$$

$$\sigma_2 = 10269 - 15966 = -5697 \text{ psi}$$

$$2\phi_o = \tan^{-1}\left(\frac{12225}{10269}\right) = 49.97^\circ$$

$$\phi_o = 24.98^\circ \text{ CCW}$$

$$2\phi_r = \phi_o + 90^\circ = 139.97^\circ$$

$$\phi_r = 69.98^\circ$$

32.

USE $D = 1.500 \text{ IN}$ FOR SHAFT ABC. STREES ELEMENT ON BOTTOM.

FROM SOLUTION FOR PROBLEM 3-40, $M_B = 4572 \text{ LB-IN}$; $T_B = 6400 \text{ LB-IN}$.

$$Z = \pi D^3/32 = 0.3313 \text{ IN}^3; \sigma_B = M_B/Z = 4572 \text{ LB-IN}/0.3313 \text{ IN}^3 = 13800 \text{ psi} = \sigma_x$$

$$Z_p = \pi D^3/16 = 22 = 0.6627 \text{ IN}^3; T_B = T_B/Z_p = 6400/0.6627 = 9658 \text{ psi}$$

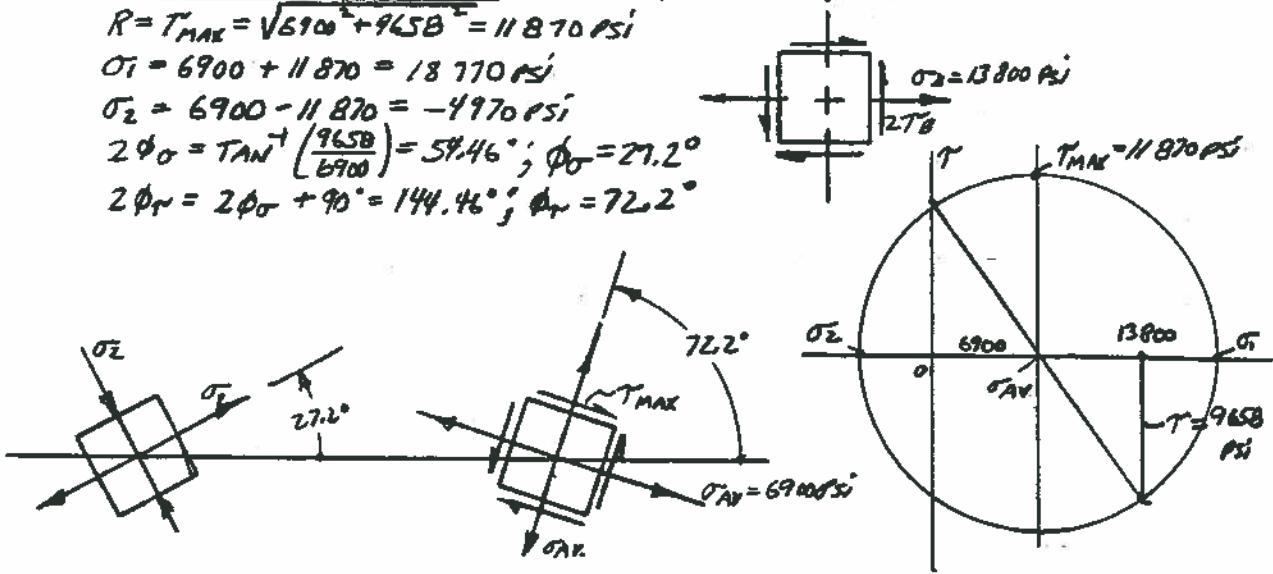

$$R = T_{MAX} = \sqrt{6900^2 + 9658^2} = 11870 \text{ psi}$$

$$\sigma_i = 6900 + 11870 = 18770 \text{ psi}$$

$$\sigma_2 = 6900 - 11870 = -4970 \text{ psi}$$

$$2\phi_o = \tan^{-1}\left(\frac{9658}{6900}\right) = 59.46^\circ; \phi_o = 27.2^\circ$$

$$2\phi_r = 2\phi_o + 90^\circ = 144.46^\circ; \phi_r = 72.2^\circ$$

33.

USE $D = 2.25 \text{ IN.}$ FOR SHAFT ABC. : STRESS ELEMENT ON BOTTOM.

FROM SOLUTION FOR PROBLEM 3-49,

$$M_B = 8640 \text{ LB-IN}; T_B = 400 \text{ LB-FT}$$

$$Z = \pi D^3/32 = 1118 \text{ IN}^3; \sigma_B = M/Z = 8640 \text{ LB-IN}/1118 \text{ IN}^3 = 7726 \text{ PSI TENSION}$$

$$Z_P = \pi D^3/16 = 22 = 2.237 \text{ IN}^3; T_B = T_B/Z_P = 400 \text{ LB-IN}/2.237 \text{ IN}^3 = 179 \text{ PSI}$$

$$R = T_{MAX} = \sqrt{179^2 + 3863^2} = 3867 \text{ psi}$$

$$\sigma_1 = 3863 + 3867 = 7730 \text{ psi}$$

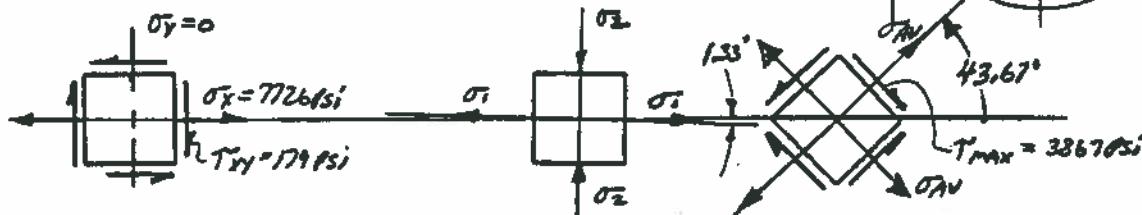

$$\sigma_2 = 3863 - 3867 = -4 \text{ psi}$$

$$2\phi_o = \tan^{-1}(179/3863) = 2.65^\circ$$

$$\phi_o = 1.33^\circ \text{ CW}$$

$$2\phi_r = 90^\circ - 2\phi_o = 87.35^\circ$$

$$\phi_r = 43.67^\circ \text{ CCW}$$

34.

USE $D = 50.0 \text{ mm}$ FOR SHAFT AB: STRESS ELEMENT ON BOTTOM.

FROM SOLUTION FOR PROBLEM 3-50,

$$M_A = -0.650 \text{ kN-m}; T_A = 0.375 \text{ kN-m}$$

$$Z = \pi D^3/32 = 12.272 \text{ mm}^3; \sigma_A = M/Z = \frac{650 \text{ N-mm}}{12.272 \text{ mm}^3} \cdot \frac{10^3 \text{ mm}}{\text{m}} = 52.91 \text{ MPa COMPRESSION.}$$

$$Z_P = \pi D^3/16 = 22 = 24544 \text{ mm}^3; T_A = \frac{T}{Z_P} = \frac{375 \text{ N-mm}}{24544 \text{ mm}^3} \cdot \frac{10^3 \text{ mm}}{\text{m}} = 15.28 \text{ MPa}$$

$$R = T_{MAX} = \sqrt{15.28^2 + 26.48^2} = 30.57 \text{ MPa}$$

$$\sigma_1 = -26.48 + 30.57 = 4.09 \text{ MPa}$$

$$\sigma_2 = -26.48 - 30.57 = -57.05 \text{ MPa}$$

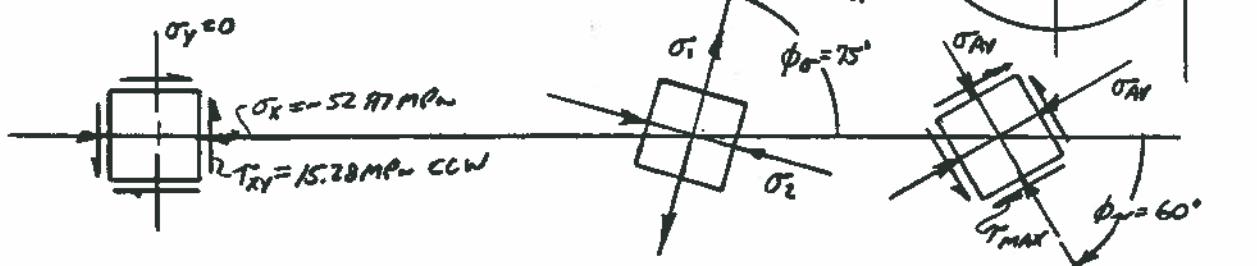

$$\alpha = \tan^{-1}(15.28/26.48) = 30.0^\circ$$

$$2\phi_o = 180^\circ - \alpha = 150^\circ$$

$$\phi_o = 75^\circ \text{ CCW}$$

$$2\phi_r = 90^\circ + \alpha = 120^\circ$$

$$\phi_r = 60^\circ \text{ CW}$$

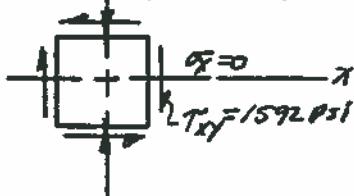

35.

SURFACE ELEMENT

$$R = T_{\max} = \sqrt{1592^2 + 2984^2} = 3382 \text{ PSI}$$

$$\sigma_1 = -2984 + 3382 = 398 \text{ PSI}$$

$$\sigma_2 = -2984 - 3382 = -6366 \text{ PSI}$$

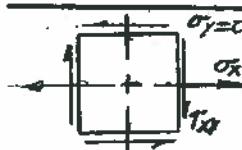

36.

$$D = 20 \text{ mm} ; A = \pi D^2/4 = 314 \text{ mm}^2$$

$$\sigma_x = \frac{F}{A} = \frac{36000 \text{ N}}{314 \text{ mm}^2} = 114.6 \text{ MPa} \text{ TENSION}$$

$$Z_p = \frac{\pi D^3}{16} = 1571 \text{ mm}^3$$

$$T_{xy} = T/Z_p = \frac{450 \text{ N-m}}{1571 \text{ mm}^3} \times \frac{10 \text{ mm}}{m} = 286.48 \text{ MPa}$$

$$\sigma_{avg} = \frac{114.6 + 0}{2} = 57.3 \text{ MPa}$$

$$R = T_{\max} = \sqrt{57.3^2 + 286.5^2}$$

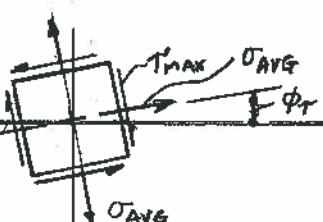

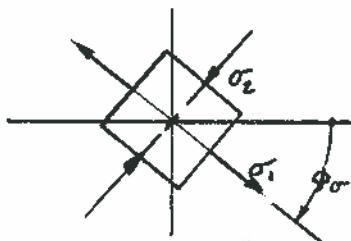

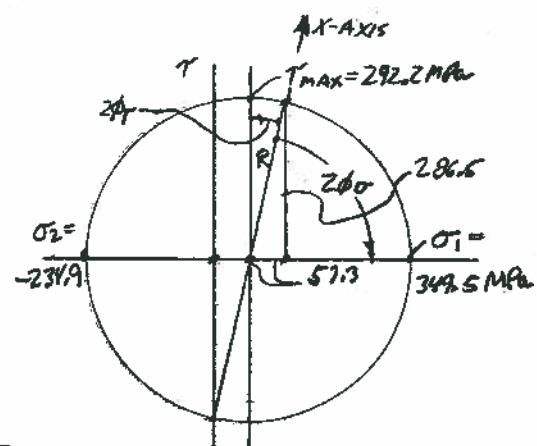

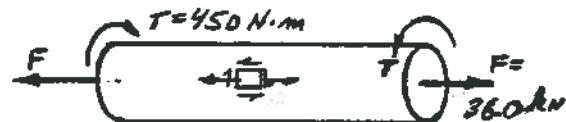

$$T_{\max} = 292.2 \text{ MPa}$$

$$\sigma_1 = 57.3 + 292.2 = 349.5 \text{ MPa}$$

$$\sigma_2 = 57.3 - 292.2 = -234.9 \text{ MPa}$$

$$2\phi_o = \tan^{-1}(286.5/57.3) = 78.7^\circ; \phi_o = 39.35^\circ$$

$$2\phi_T = 90 - 2\phi_o = 11.3^\circ; \phi_T = 5.65^\circ$$

CHAPTER 5

DESIGN FOR DIFFERENT TYPES OF LOADING

Stress Ratio

1.

$$\sigma = F/A : A = \frac{\pi(10\text{ mm})^2}{4} = 78.54\text{ mm}^2 \quad \text{or}$$

$$\sigma_{\text{MAX}} = 3500\text{ N}/78.54\text{ mm}^2 = 44.6\text{ MPa}$$

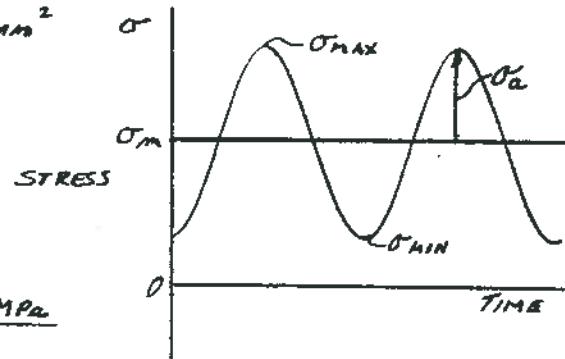

$$\sigma_{\text{MIN}} = 500\text{ N}/A = 6.37\text{ MPa}$$

$$F_m = (3500 + 500)/2 = 2000\text{ N}$$

$$\sigma_m = 2000\text{ N}/A = 25.5\text{ MPa}$$

$$\sigma_a = \sigma_{\text{MAX}} - \sigma_m = 44.6 - 25.5 = 19.10\text{ MPa}$$

$$R = \sigma_{\text{MIN}}/\sigma_{\text{MAX}} = 6.37/44.6 = 0.143$$

2.

$$\sigma = F/A : A = (10\text{ mm})(30\text{ mm}) = 300\text{ mm}^2$$

$$\sigma_{\text{MAX}} = 20 \times 10^3 \text{ N}/300\text{ mm}^2 = 66.7\text{ MPa}$$

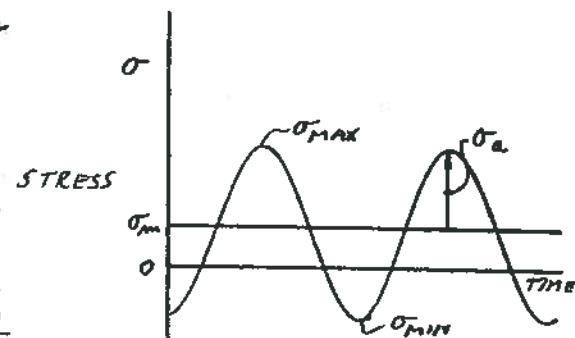

$$\sigma_{\text{MIN}} = -8.0 \times 10^3 \text{ N}/A = -26.7\text{ MPa}$$

$$F_m = (20 - 8)/2 = 6\text{ kN}$$

$$\sigma_m = 6 \times 10^3 \text{ N}/A = 20.0\text{ MPa}$$

$$\sigma_a = \sigma_{\text{MAX}} - \sigma_m = 66.7 - 20.0 = 46.7\text{ MPa}$$

$$R = \sigma_{\text{MIN}}/\sigma_{\text{MAX}} = -26.7/66.7 = -0.40$$

3.

$$\sigma = F/A : A = (0.40\text{ in})^2 = 0.16\text{ in}^2$$

$$\sigma_{\text{MAX}} = 860\text{ lb}/0.16\text{ in}^2 = 5375\text{ psi}$$

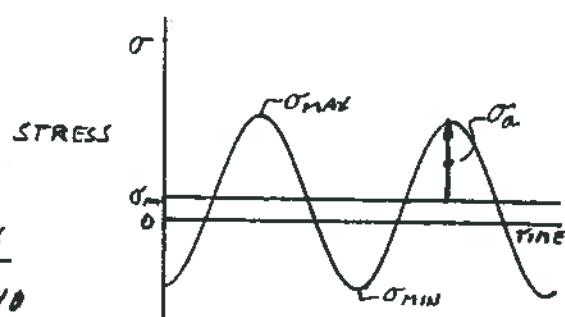

$$\sigma_{\text{MIN}} = -120\text{ lb}/0.16\text{ in}^2 = -750\text{ psi}$$

$$F_m = (860 - 120)/2 = 370\text{ lb}$$

$$\sigma_m = 370\text{ lb}/A = 2313\text{ psi}$$

$$\sigma_a = \sigma_{\text{MAX}} - \sigma_m = 5375 - 2313 = 3062\text{ psi}$$

$$R = \sigma_{\text{MIN}}/\sigma_{\text{MAX}} = -750/5375 = -0.140$$

4.

$$\sigma = F/A : A = \pi D^2/4 = \pi (0.395)^2/4 = 0.1104\text{ in}^2$$

$$\sigma_{\text{MAX}} = 1800\text{ lb}/0.1104\text{ in}^2 = 16297\text{ psi}$$

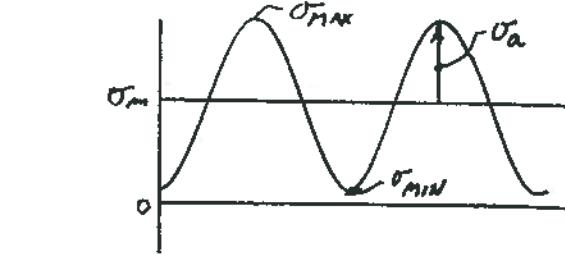

$$\sigma_{\text{MIN}} = 150\text{ lb}/0.1104\text{ in}^2 = 1358\text{ psi}$$

$$F_m = (1800 + 150)/2 = 975\text{ lb}$$

$$\sigma_m = 975\text{ lb}/A = 8828\text{ psi}$$

$$\sigma_a = \sigma_{\text{MAX}} - \sigma_m = 16297 - 8828 = 7470\text{ psi}$$

$$R = \sigma_{\text{MIN}}/\sigma_{\text{MAX}} = 1358/16297 = 0.083$$

5. $\sigma = F/A; A = \frac{\pi D^2}{4} = \frac{\pi (3.0\text{ mm})^2}{4} = 7.069\text{ mm}^2$

$$\sigma_{\text{MAX}} = 780\text{ N}/7.069\text{ mm}^2 = 110.3\text{ MPa}$$

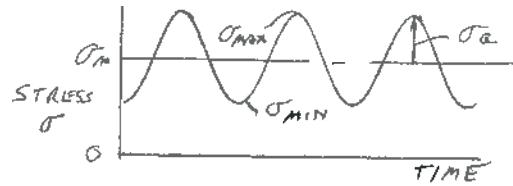

$$\sigma_{\text{MIN}} = 360\text{ N}/A = 50.9\text{ MPa}$$

$$F_m = (780 + 360)/2 = 570\text{ N}$$

$$\sigma_m = 570\text{ N}/A = 80.6\text{ MPa}$$

$$\sigma_a = 110.3 - 80.6 = 29.7\text{ MPa}$$

$$R = 50.9/110.3 = 0.462$$

6.

$\sigma = M/S; S_y = 1.48\text{ in}^3$ FOR $4 \times 2 \frac{1}{4}$ TUBE V APP15-14

AT B

$$\sigma_{\text{MAX}} = \frac{14400}{1.48} = 9730\text{ psi}$$

$$\sigma_{\text{MIN}} = \frac{10560}{1.48} = 7135\text{ psi}$$

$$\sigma_m = (9730 + 7135)/2 = 8432\text{ psi}$$

$$\sigma_a = \sigma_{\text{MAX}} - \sigma_m = 9730 - 8432 = 1298\text{ psi}$$

$$\sigma_a = 2595\text{ psi}$$

$$R = \sigma_{\text{MIN}}/\sigma_{\text{MAX}} = \frac{7135}{9730}$$

$$R = 0.733$$

$$\sigma_{\text{MIN}} = \sigma_{\text{MAX}} - R\sigma_{\text{MAX}} = 9730 - 0.733 \cdot 9730 = 2595\text{ psi}$$

$$\sigma_a = \sigma_{\text{MAX}} - \sigma_m = 9730 - 8432 = 1298\text{ psi}$$

$$R = \sigma_{\text{MIN}}/\sigma_{\text{MAX}} = \frac{7135}{9730}$$

$$R = 0.733$$

STRESS VS. TIME DIAGRAM-SAM AS FOR PROB. 5.

7.

BEAM: $\sigma = \frac{M}{S} ; S = 3.04\text{ in}^3$ FOR $S4 \times 7.7$

$$M_{\text{MAX}} = (500\text{ lb})(60\text{ in}) = 30000\text{ lb-in} = M_1$$

$$M_{\text{MIN}} = (500\text{ lb})(60\text{ in}) = -5000\text{ lb-in} = M_2$$

$$M_m = (30000 + 5000)/2 = 17500\text{ lb-in}$$

$$M_a = 30000 - 17500 = 12500\text{ lb-in}$$

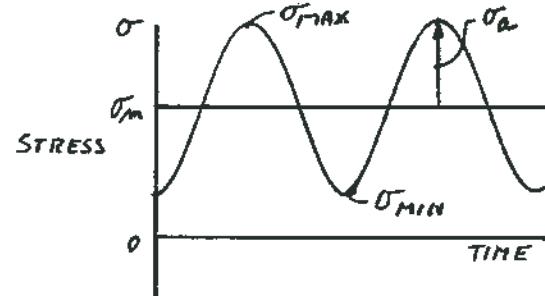

$$\sigma_{\text{MAX}} = \frac{30000\text{ lb-in}}{3.04\text{ in}^3} = 9868\text{ psi}$$

$$\sigma_{\text{MIN}} = 5000/3.04 = 1645\text{ psi}$$

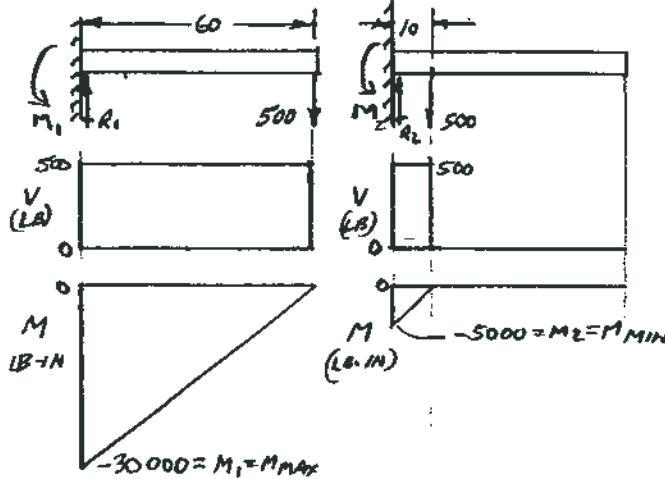

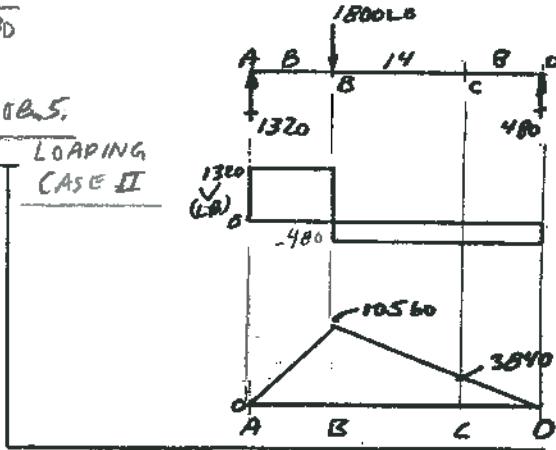

$$\sigma_m = 17500/3.04 = 5757\text{ psi}$$

$$\sigma_a = 12500/3.04 = 412\text{ psi}$$

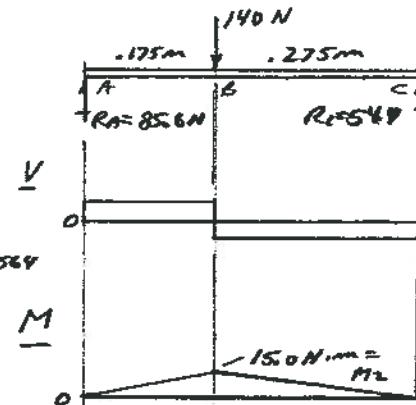

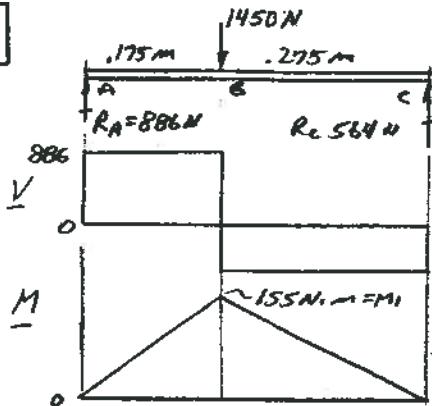

$$R = \frac{\sigma_{\text{MIN}}}{\sigma_{\text{MAX}}} = \frac{1645}{9868} = 0.167$$

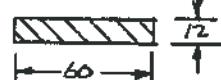

LOADING CASE II

8.

BEAM CROSS SECTION

$$S = \frac{bh^2}{6} = \frac{(60)(12)^2}{6} = 1440 \text{ mm}^3$$

$$\sigma = \frac{M}{S} \text{ BENDING}$$

$$\sigma_{\max} = \frac{M_1}{S} = \frac{155 \text{ N-mm}}{1440 \text{ mm}^3} \cdot \frac{10^3 \text{ mm}}{\text{m}} = 107.7 \text{ MPa}$$

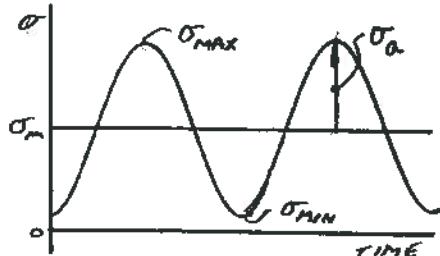

$$\sigma_{\min} = \frac{M_2}{S} = \frac{15.0 \times 10^3 \text{ N-mm}}{1440 \text{ mm}^3} = 10.4 \text{ MPa}$$

$$\sigma_m = (107.7 + 10.4)/2 = 59.1 \text{ MPa}$$

$$\sigma_a = \sigma_{\max} - \sigma_m = 107.7 - 59.1 = 48.6 \text{ MPa}$$

$$R = \sigma_{\max}/\sigma_{\min} = 10.4/107.7 = 0.097$$

STRESS

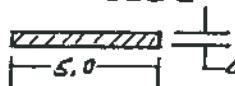

9.

SPRING IS A SUPPORTED CANTILEVER - CASE (b) APP A/4-3.

DEFLECTION PROPORTIONAL TO FORCE. BENDING MOMENT PROPORTIONAL TO FORCE.

DEFLECTION AT LOAD B:

$$M_B = \frac{-P a^2 b^2}{12 E I L^3} (3L + b)$$

$$I = \frac{6(1.6)^3}{12} = 0.096 \text{ mm}^4$$

$$S = \frac{56.6^2}{6} = 0.30 \text{ mm}^3$$

$$E = 207 \times 10^3 \text{ N/mm}^2$$

SOLVE FOR P:

$$P = \frac{12 E I L^3 M_B}{a^3 b^2 (3L + b)} = \frac{(12)(207 \times 10^3)(0.096)(40)^3 M_B}{(15)^3 (25)^2 [3(40) + 25]} \text{ N}$$

$$P = 46.78 M_B$$

FOR $M_B = 0.25 \text{ mm}$; $P_1 = 46.78 (0.25) = 11.7 \text{ N}$; FOR $M_B = 0.40 \text{ mm}$, $P_2 = 18.7 \text{ N}$

MOMENTS:

$$M_A = \frac{-P a b}{2 L^2} (b + L) = \frac{-P (15)(25)}{2(40)^2} (25 + 40) = 7.617 P \text{ MAXIMUM}$$

$$M_B = \frac{P a^2 b}{2 L^3} (b + 2L) = \frac{P (15)^2 (25)}{2 (40)^3} [25 + 2(40)] = 4.614 P$$

SUMMARY

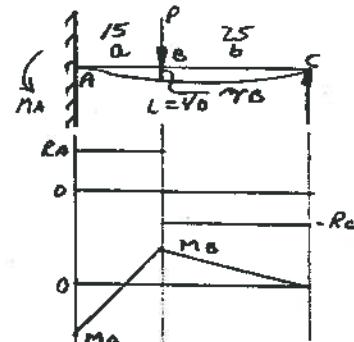

$$P_2 = 18.7 \text{ N}; M_{A2} = 7.617(18.7) = 142.5 \text{ N-mm}; \sigma_{a2} = \frac{M}{S} = \frac{142.5 \text{ N-mm}}{0.30 \text{ mm}^3} = 475 \text{ MPa} = \sigma_{\max}$$

$$P_1 = 11.7 \text{ N}; M_{A1} = 89.1 \text{ N-mm}; \sigma_{a1} = 297 \text{ MPa} = \sigma_{\min}$$

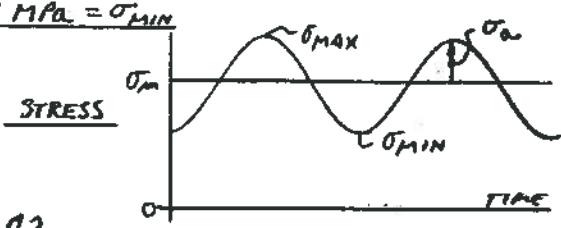

$$\sigma_m = (475 + 297)/2 = 386 \text{ MPa}$$

$$\sigma_a = 475 - 297 = 178 \text{ MPa}$$

$$R = \sigma_{\min}/\sigma_{\max} = 297/475 = 0.625$$

Design and Analysis

Problems 15 - 18 are open-ended design problems for which there is no unique answer. The General Design Procedure from Section 5-9 should be used. The loading and support conditions should be compared with the cases described in Section 5-8 to determine the appropriate design stress. A design factor should be specified using the guidelines in Section 5-7. When needed, the endurance strength should be computed from Equation 5-6 in Section 5-4.

15. The link is subjected to a fluctuating normal stress. Use Case 5 from Section 5-8. See also the solution for Problem 1.
16. The rod is subjected to a fluctuating normal stress. Use Case 5 from Section 5-8. See also the solution for Problem 4.
17. The strut is subjected to a fluctuating normal stress. Use Case 5 from Section 5-8. See also the solution for Problem 2.
18. The latch part is subjected to a fluctuating normal stress. Use Case 5 from Section 5-8. See also the solution for Problem 5.

19.

FIG. 85-8. SEE ALSO PROBLEM 8 SOLUTION. FLUCTUATING LOAD

$$\frac{1}{N} = \frac{\sigma_m + K_c \sigma_a}{S_m} \quad \text{CASE 5} \quad \sigma_m = 59.1 \text{ MPa}; \sigma_a = 48.6 \text{ MPa}$$

FIND N. SAE 1020 HR; $S_y = 207 \text{ MPa}$; $S_u = 379 \text{ MPa}$; $S_a = 140 \text{ MPa}$

C_S : RECTANGLE: $D_e = 0.808 T_{12(60)} = 21.7 \text{ mm}$; $C_S = 0.89$ FIG. 5-8 Hot ROL.

$C_m = 1.0$ (WIDE FLAT STEEL), $C_{st} = 1.0$ (REV. BENDING); LET $R = 0.99 - C_R = 0.81$

$$S_m = (0.89)(1.0)(1.0)(0.81)(140) = 101 \text{ MPa} \quad \text{YIELD: } N = \frac{S_y}{K_c(\sigma_m + \sigma_a)}$$

$$\frac{1}{N} = \frac{59.1}{379} + \frac{(1.0)(48.6)}{101} = 0.637; \quad N = 1.57 \quad N_y = \frac{207}{1(59.1 + 48.6)} = 1.92$$

LOW

20.

DESIGN PROBLEM - NO UNIQUE SOLUTION.

SUGGESTIONS: KEEP 60 mm WIDTH FOR SEAT APPLICATION.

CONSIDER HIGHER STRENGTH MATERIAL; THINNER STOCK FORMED INTO CHANNEL SHAPE . CONSIDER TAPERING CROSS SECTION

DEPTH - DEEPER AT LOAD - LESS DEEP NEAR SUPPORTS WHERE MOMENT IS SMALLER. CONSIDER REF. A - APP. 15-7 OR REF. G - APP. 15-8. ALUMINUM.

21.

DATA ARE SAME AS IN PROB. 7 WHERE AN S4X7.7 STEEL BEAM WAS PROPOSED. FLUCTUATING STRESS. USE CASE 5. $A_t = 226 \text{ in}^2$

$$\frac{1}{N} = \frac{\sigma_m + K_c \sigma_a}{S_m} \quad \text{SPECIFY ASTM A36 STEEL } S_y = 36 \text{ ksi}, S_u = 58 \text{ ksi} \\ S_m = 20 \text{ ksi} (\text{Fig. 5-8}), \quad C_S; A_{95} = 0.05 A_t = 0.05(2.26 \text{ in}^2) = 0.113 \text{ in}^2 = 0.0766 D_e^2 \\ D_e = \sqrt{0.113 / 0.0766} = 1.215 \Rightarrow C_S = 0.86$$

$C_m = 1.0$; $C_{st} = 1.0$; LET $R = 0.99 - C_R = 0.81$.

$$S_m = (0.86)(0.81)(20) = 13.9 \text{ ksi}; \sigma_m = 5157 \text{ psi}, \sigma_a = 4112 \text{ psi} - \text{PROB. 7.}$$

$$\frac{1}{N} = \frac{5157 \text{ psi}}{58000 \text{ psi}} + \frac{1.0(4112) \text{ psi}}{13900 \text{ psi}} = 0.395; \quad N = 2.53$$

CHECK YIELD:

$$N = \frac{S_y}{K_c(\sigma_a + \sigma_m)} = \frac{36000}{1(4112 + 5157)} = 3.65$$

$N = 2.53$ IS SATISFACTORY IF NO UNUSUAL CONDITIONS OR UNCERTAINTY OF DATA EXIST.

22.

DATA SAME AS PROBLEM 9. FLUCTUATING NORMAL STRESS - CASE 5.

$\sigma_m = 386 \text{ MPa}$; $\sigma_a = 89 \text{ MPa}$. FROM APP. 3 AISI 4140 00T400 HAS THE HIGHEST S_u WITH >10% ELONGATION FOR 6000 DUCTILITY.

65

IMPROVEMENTS: 1.) INCREASE THICKNESS, 2.) INCREASE FILLET RADIUS,

3.) USE STRONGER MATERIAL, 4.) INCREASE PIN HOLE SIZE-OR-

CHANGE MANNER OF APPLYING FORCE TO THE PART TO
ELIMINATE HOLE - OR - MAKE PART THICKER AT THE HOLES THAN
IN MIDDLE OF THE PART. MATERIAL MAY BE REMOVED IN 2.00 IN.
SECTION NEAR MIDDLE OF PART TO OFFSET ADDED MATERIAL
ELSEWHERE. COULD TRY TITANIUM WITH LOWER DENSITY THAN
STEEL. THIS PROBLEM MAY BE TOO RESTRICTIVE TO PERMIT

A PRACTICAL SOLUTION WITH DATA IN THIS BOOK. MAY
HAVE TO ACCEPT LOWER $N < 3.0$ OR SOME INCREASE IN
WEIGHT OF THE COMPONENT.

66 FLUCTUATING NORMAL STRESS - CASE 5 - EQ. 5-20.

ECCENTRIC COLUMN ANALYSIS

Data from: Problem 6-37

Solves Equation 6-13 for design stress and Equation 6-14 for maximum deflection

Enter data for variables in *italics* in shaded boxes

Data To Be Entered:

Length and End Fixity:

Column length, L = 126 in
End fixity, K = 1

Material Properties:

Yield strength, s_y = 46000 psi
Modulus of Elasticity, E = 2.90E+07 psi

Cross Section Properties:

[Note: Enter *r* or compute *r* = $\sqrt{I/A}$]

[Always enter Area]

[Enter zero for *I* or *r* if not used]

Area, A = 6.020 in²
Moment of Inertia, I = 0 in⁴

Radius of Gyration, r = 1.410 in

Values for Eqns. 6-13 and 6-14:

Eccentricity = e = 3 in
Neutral axis to outside = c = 2 in
Allowable load = P_a = 17600 lb

Design Factor

Design factor on load, N = 3

Use consistent U.S. Customary units.

Computed Values:

Eq. Length, L_e = KL = 126.0 in

Column constant, C_c = 111.6

Argument for secant = 0.777 for strength
 Value of secant = 1.4025

Argument for secant = 0.449 for deflection
 Value of secant = 1.1098

Slenderness ratio, KL/r = 89.4

Column is: **short**

Req'd yield strength = 45,896 psi

Must be less than actual yield strength:

s_y = 46,000 psi

Max. deflection, y_{max} = 0.329 in

Note: *A* and *r* from Appendix 15-14

Factor of safety, $F_s = 3$

$$\text{NOTE! } A = (1.50 \text{ in})(0.40 \text{ in}) = 0.600 \text{ in}^2$$

$$r = \frac{H}{\sqrt{l}} = \frac{1.50 \text{ in}}{\sqrt{l}} = 0.433 \text{ in} ; P_a = 685 \text{ lb.}$$

ECCENTRIC LOAD TENDS TO BUCKLE THE BAR ABOUT ITS STRONG AXIS.
BUT SEE SOLUTION 38B. LIMITING LOAD IS 163 LB FOR BUCKLING
ABOUT THIN AXIS.

Computed Values:

NOTE: This solution considers the eccentric load with bending about the horizontal axis.

$$\rightarrow \text{Eq. Length, } L_e = KL = 40.0 \text{ in}$$

$$\rightarrow \text{Column const., } C_c = 70.2$$

$$\begin{aligned} \text{Argument of sec} &= 0.855 \text{ for strength} \\ \text{Value of secant} &= 1.5236 \end{aligned}$$

$$\begin{aligned} \text{Argument of sec} &= 0.494 \text{ for deflection} \\ \text{Value of secant} &= 1.1355 \end{aligned}$$

$$\rightarrow \text{Slender. ratio, } KL/r = 92.4$$

Column is: long

FINAL RESULTS

Req'd yield strength = 39,954 psi

Must be less than actual yield strength:

$$s_y = 40,000 \text{ psi}$$

$$\text{Max Deflection, } y_{max} = 0.237 \text{ in}$$

See also Solution 38B for buckling about the thinner vertical axis.

COLUMN ANALYSIS PROGRAM

Refer to Figure 6-4 for analysis logic

Enter data for variables involved in shaded boxes

Data from: Problem 6-38B-US

Use consistent U.S. Customary units.

Data to Be Entered:

Length and End Fixity:

Column length, $L = 40 \text{ in}$
End fixity, $K = 1$

Material Properties:

Yield strength, $\sigma_y = 40000 \text{ psi}$
Modulus of elasticity, $E = 1.00E+07 \text{ psi}$

Gross Section Properties:

(Note: Enter r or compute $r = \sqrt{I/A}$)

(Always enter Area)

Enter zero for r or r if not used)

Area, $A = 0.8 \text{ in}^2$
Moment of inertia, $I = 0.16 \text{ in}^4$

Radius of gyration, $r_c = 0.416 \text{ in}$

Design Factor:

Design factor on load, $N = 3$

Computed Values:

Eq. Length, $L_e = KL = 40.0 \text{ in}$

Column const., $C_c = 70.2$

NOTE: Cross section properties taken with respect to the vertical axis because the load is central to that axis. But buckling is expected about the axis through the thin (0.40 in) section.

Slender. ratio, $KL/r = 347.8$

Column is: long

Critical Buckling Load = 489 lb

Allowable Load = 163 lb

This value governs the design, not solution 38A

ANALYSIS AS A STRAIGHT CENTRALLY LOADED COLUMN
THAT TENDS TO BUCKLE ABOUT THIN AXIS, $t = 0.40 \text{ in}$

$$r = \frac{t}{\sqrt{2}} = \frac{0.40 \text{ in}}{\sqrt{2}} = 0.115 \text{ in}$$

FROM EULER FORMULA WITH $N=3$ $P_a = 163 \text{ lb.}$

ECCENTRIC COLUMN ANALYSIS

Data from: Problem 39-5

Solves Equation 6-13 for design stress and Equation 6-14 for maximum deflection

Entered data for variables: [Initial values in shaded boxes]

Use consistent SI Metric units

Data to Be Entered:

Length and End Fixity:

Column length, $L = 750 \text{ mm}$
End fixity, $K = 2$

Material Properties:

Yield strength, $s_y = 366 \text{ MPa}$
Modulus of elasticity, $E = 200 \text{ GPa}$

Cross-Section Properties:

[Note: Enter non-computer $r = \text{min}(r_e/A)$]
Always enter Area:
[Enter zero for I_0 or a if not used]

Area, $A = 914 \text{ mm}^2$
Moment of inertia, $I = 0 \text{ mm}^4$

OR

Radius of gyration, $r = 75.0 \text{ mm}$
Values for Eqs. 6-13 and 6-14:
Eccentricity, $e = 20 \text{ mm}$

Neutral axis (outside) $c = 125 \text{ mm}$
Allowable load, $P_a = 5200 \text{ N}$

Design Factor:
Design factor on load, $N = 3$

Computed Values:

Eq. Length, $L_e = KL = 750.0 \text{ mm}$

Column const., $C_c = 63.9$

Argument of sec = 0.811 for strength
Value of secant = 1.4512

Argument of sec = 0.468 for deflection
Value of secant = 1.1205

Slender. ratio, $KL/r = 102.9$

Column is: long

FINAL RESULTS

Req'd yield strength = 389 MPa

Must be less than actual yield strength:

$s_y = 366 \text{ MPa}$

Max Deflection, $y_{\max} = 2.41 \text{ mm}$

Piston rod is safe for $P_a = 5200 \text{ N}$.

COLUMN ANALYSIS PROGRAM

Refer to Figure 6-4 for analysis logic

Enter data for variables in **values in shaded boxes**

Data To Be Entered:

Length and End Fixity:

Column length, $L = 156 \text{ in}$

End fixity, $K = 1$

Material Properties:

Yield strength, $s_y = 36000 \text{ psi}$

Modulus of Elasticity, $E = 3.00E+07 \text{ psi}$

Cross Section Properties:

[Note: Enter r or compute $r = \sqrt{l/A}$]

[Always enter Area]

[Enter zero for I or r if not used]

Area, $A = 1.075 \text{ in}^2$

Moment of Inertia, $I = 0 \text{ in}^4$

Or

Radius of Gyration, $r = 0.777 \text{ in}$

Design Factor:

Design factor on load, $N = 3$

Data from: Problem 40A-Straight

Use consistent U.S. Customary units.

Computed Values:

NOTE: Analysis of straight pipe. See also Solution 40B for crooked pipe.

Eq. Length, $L_e = KL = 156.0 \text{ in}$

Column const., $C_c = 128.3$

Slender. ratio, $KL/r = 198.2$

Column is: long

Critical Buckling Load = 8,101 lb

Straight Pipe

Allowable Load = 2,700 lb

See also Solution 40B for crooked pipe.

CROOKED COLUMN ANALYSIS

Solves Equation 6-11 for Allowable Load

Enter data for variables in boxes in shaded boxes

Data To Be Entered:

Length and End Fixity:

Column length, $L = 156 \text{ in}$

End fixity, $K = 7$

Material Properties:

Yield strength, $s_y = 36000 \text{ psi}$

Modulus of Elasticity, $E = 3.00E+07 \text{ psi}$

Cross Section Properties:

[Note: Enter r or computer $r = \sqrt{I/A}$] [Always enter Area]

[Enter zero for I or r if not used]

Area, $A = 1.075 \text{ in}^2$

Moment of Inertia, $I = 0 \text{ in}^4$

Radius of gyration, $r = 0.787 \text{ in}$

Values for Eqn. 6-11:

Initial crookedness = $a = 1.25 \text{ in}$

Neutral axis to outside = $c = 1.185 \text{ in}$

Design Factor

Design factor on load, $N = 5$

Data from: Problem 40B-Crooked

Use consistent U.S. Customary units.

Computed Values:

Eq. Length, $L_e = KL = 156.0 \text{ in}$

Column const., $C_c = 128.3$

Euler buckling load = 8101 lb

C_1 in Eqn. 6-11 = -22074

C_2 in Eqn. 6-11 = 3.483E+07

Slender. ratio, $KL/r = 198.2$

Column is: long

Straight Column

Critical Buckling Load = 8,101 lb

Crooked Column

Allowable Load = 1,711 lb

This value governs the use of the pipe.

See solution for straight pipe; Problem 40A.

CHAPTER 7

BELT DRIVES AND CHAIN DRIVES

V-BELTS

1. $C \leq 24.0 \text{ in} ; D_2 = 13.95 \text{ in} ; D_1 = 5.25 \text{ in} ; 3V \text{ BELT}$

EQ. 7-31

$$L = 2(24) + 1.57 (13.95 + 5.25) + \frac{(13.95 - 5.25)^2}{4(24)} = 78.23 \text{ in}$$

USE $L = 75 \text{ in}$ - STANDARD LENGTH

2. ACTUAL C FROM EQ. 7-4: $L = 75$

$$B = 4(75) - 6.28 (13.95 + 5.25) = 179.4$$

$$C = \frac{179.4 + \sqrt{(179.4)^2 - 32(13.95 - 5.25)^2}}{16} = 22.00 \text{ in}$$

3. $\theta_1 = 180^\circ - 2 \sin^{-1} \left[\frac{13.95 - 5.25}{2(22.0)} \right] = 157.2^\circ$ (EQ. 7-5)

$$\theta_2 = 180^\circ + 2 \sin^{-1} \left[\frac{13.95 - 5.25}{2(22.0)} \right] = 202.8^\circ$$
 (EQ. 7-6)

4. $C \leq 60.0 \text{ in} ; D_2 = 27.7 \text{ in} ; D_1 = 8.4 \text{ in} ; 5V \text{ BELT}$ (EQ. 7-3)

COMPUTED $L = 178.2 \text{ in}$. USE $L = 170 \text{ in}$

5. ACTUAL C = 55.83 in. (EQ. 7-4)

6. $\theta_1 = 160.1^\circ ; \theta_2 = 199.9^\circ$ (EQ. 7-5), (EQ. 7-6)

7. $C \leq 144 \text{ in} ; D_2 = 94.8 \text{ in} ; D_1 = 13.8 \text{ in} ; 8V \text{ BELT}$ (EQ. 7-3)

COMPUTED $L = 469.9 \text{ in}$. USE $L = 450 \text{ in}$.

8. ACTUAL C = 133.61 in (EQ. 7-4)

9. $\theta_1 = 144.7^\circ ; \theta_2 = 215.3^\circ$ (EQ. 7-5, 7-6)

10. $N_L = R_1 \omega_1 = \frac{5.25 \text{ in}}{2} \times \frac{1750 \text{ REV}}{\text{MIN}} \times \frac{2\pi \text{ RAD}}{\text{REV}} \times \frac{1 \text{ FT}}{12 \text{ IN}} = 2405 \text{ FT/MIN}$

11. $N_b = R_1 \omega_1 = \frac{8.4 \text{ in}}{2} \times \frac{1160 \text{ REV}}{\text{MIN}} \times \frac{2\pi \text{ RAD}}{\text{REV}} \times \frac{1 \text{ FT}}{12 \text{ IN}} = 2551 \text{ FT/MIN}$

12. $N_b = R_1 \omega_1 = \frac{13.8 \text{ in}}{2} \times \frac{870 \text{ REV}}{\text{MIN}} \times \frac{2\pi \text{ RAD}}{\text{REV}} \times \frac{1 \text{ FT}}{12 \text{ IN}} = 3143 \text{ FT/MIN}$

13. $RATIO = 13.95 / 5.25 = 2.66 ; P \cong 6.25 \text{ hp} ; C_d = 0.94 ; C_L = 1.03$

CORRECTED POWER = $C_d C_L P = (0.94)(1.03)(6.25) = 6.05 \text{ hp}$

- $$L = 2(40) + \frac{29+15}{2} + \frac{(29-15)^2}{4\pi^2(40)} = 102.1 \text{ PITCHES} \rightarrow \text{USE } 102 \text{ PITCHES} = L$$
- $$C = \frac{1}{4} \left[102 - \frac{29+15}{2} + \sqrt{\left[102 - \frac{29+15}{2} \right]^2 - \frac{8(29-15)^2}{4\pi^2}} \right] = 39.94 \text{ PITCHES} = C$$
- $$\underline{C = 39.94 \text{ IN.}}$$

Problems 38-42 are design problems for chain drives for which there are no unique solutions. The general procedure is illustrated above for one possible solution for Problem 38. This and the other design problems are shown on the following pages using the spreadsheet that is available from the publisher's website for this book. Data for design power per strand from Tables 7-7, 7-8, or 7-9 must be used to ensure that the selected chain design has sufficient capacity.

CHAIN DRIVE DESIGN

Initial Input Data:

Problem 38: Multiple strands

Application: Hammer Mill
Drive type: Electric motor
Driven machine: Hammer Mill
Power input: 25 hp
Service factor: 1.5
Input speed: 300 rpm
Desired output speed: 160 rpm

Tables 7-1
7-2
7-3
7-4

Computed Data:

Design power: 37.5 hp
Speed ratio: 1.94

Design Decisions-Chain Type and Teeth Numbers:

Number of strands:	3	2	3	4
Strand factor:	2.5	4	1.7	2.5

Required power per strand: 15.00 hp

Chain number: 80 Tables 7-7, 7-8, 7-9

Chain pitch: 1 in.

Number of teeth-Driver sprocket: 15
Computed no. of teeth-Driven sprocket: 29.06

Enter Chosen number of teeth: 29

Computed Data:

Actual output speed: 160.3 rpm
Pitch diameter-Driver sprocket: 4.810 in
Pitch diameter-Driven sprocket: 9.249 in

Center Distance, Chain Length and Angle of Wrap:

Enter nominal center distance: 40 pitches (40 to 650 increments recommended)

Computed nominal chain length: 102.1 pitches

Enter specified no. of pitches: 102 pitches (Even number recommended)

Actual chain length: 102.00 in

Computed actual center distance: 39.938 pitches

Actual center distance: 39.938 in

Angle of wrap-Driver sprocket: 173.6 degrees (100 to 180 degrees)

Angle of wrap-Driven sprocket: 186.4 degrees

CHAIN DRIVE DESIGN

Initial Input Data:	Problem 39 - Single strand				
Application:	Aerator				
Drive type:	Electric motor				
Driven machine:	Agitator				
Power input:	5 hp				
Service factor:	1	Table 7-1			
Input speed:	750 rpm				
Desired output speed:	325 rpm				
Computed Data:					
Design power:	5 hp				
Speed ratio:	2.31				
Design Decisions-Chain Type and Teeth Numbers:					
Number of strands:	1	1	2	3	4
Strand factor:	1.0	1.0	1.7	2.5	3.3
Required power per strand:	5.00 hp				
Chain number:	40	Tables 7-7, 7-8, or 7-9			
Chain pitch:	0.5 in				
Number of teeth-Driver sprocket:	18				
Computed no. of teeth-Driven sprocket:	36.92				
Enter Chosen number of teeth:	37				
Computed Data:					
Actual output speed:	324.3 rpm				
Pitch diameter-Driver sprocket:	2.563 in				
Pitch diameter-Driven sprocket:	5.896 in				
Center Distance, Chain Length and Angle of Wrap:					
Enter Nominal center distance:	32 pitches	36 to 50 pitches recommended			
Computed nominal chain length:	90.8 pitches				
Enter Specified no. of pitches:	90 pitches	Even number recommended			
Actual chain length:	45.00 in				
Computed actual center distance:	31.573 pitches				
Actual center distance:	15.787 in				
Angle of wrap-Driver sprocket:	167.9 degrees	Should be greater than 120 degrees			
Angle of wrap-Driven sprocket:	192.1 degrees				

CHAIN DRIVE DESIGN

Initial Input Data:

Problem 40 - Multiple sprockets

Application:	Conveyor
Drive type:	Engine
Driven machine:	Heavy conveyor
Power input:	40 hp
Service factor:	1.4
High speed:	500 rpm
Desired output speed:	250 rpm

Computed Data:

Design power: 56 hp
Speed ratio: 2.00

Design Decisions-Chain Type and Teeth Numbers:

Number of strands:	3	1	2	3	4
Strand factor:	2.5	4.9	7.7	10.5	13.3
Required power per strand:	22.40 hp				
Chain number:	80			Tables 7-7 & 8 pt 7-9	
Chain pitch:	1/2 in				
Number of teeth-Driven sprocket:	15				
Computed no. of teeth-Driven sprocket:	28.00				
Enter Chosen number of teeth:	28				

Computed Data:

Actual output speed: 250.0 rpm
Pitch diameter-Driver sprocket: 4.494 in
Pitch diameter-Driven sprocket: 8.931 in

Center Distance, Chain Length and Angle of Wrap:

Entered nominal chain length:	36 pitches	30 to 30 driven sprocket
Computed nominal chain length:	93.1 pitches	
Enter Specified no. of pitches:	94.0000	Over center distance entered
Actual chain length:	94.00 in	
Computed actual center distance:	36.432 pitches	
Actual center distance:	36.432 in	
Angle of wrap-Driver sprocket:	173.0 degrees	Should be greater than 120 degrees
Angle of wrap-Driven sprocket:	187.0 degrees	

CHAIN DRIVE DESIGN

Initial Input Data:		Problem 47 - Multiple strand
Application:	Pump drive	
Drive type:	Steam turbine	
Driven machine:	Centrifugal pump	
Power input:	20 hp	
Service factor:	1.0	Tables 7-1
Input speed:	2200 rpm	
Desired output speed:	775 rpm	
Computed Data:		
Design power:	20 hp	
Speed ratio:	2.84	
Design Decisions-Chain Type and Teeth Numbers:		
Number of strands:	2	2 3 4
Strand factor:	1.75	1.0 1.17 1.33
Required power per strand:	11.76 hp	
Chain number:	40	Tables 7-7 & 8 or 7-9
Chain pitch:	0.50 in.	
Number of teeth-Driver sprocket:	25	11.95 hp rating at 2200 rpm
Computed no. of teeth-Driven sprocket:	70.97	
Enter Chosen number of teeth:	71	Check availability from vendor
Computed Data:		
Actual output speed:	774.6 rpm	
Pitch diameter-Driver sprocket:	3.989 in	
Pitch diameter-Driven sprocket:	11.304 in	
Center Distance, Chain Length and Angle of Wrap:		
Enter Nominal center distance:	60 pitches	30 to 50 pitches are recommended
Computed nominal chain length:	109.8 pitches	
Enter Specified no. of pitches:	110 pitches	Even number recommended
Actual chain length:	55.00 in	
Computed actual center distance:	30.110 pitches	
Actual center distance:	15.055 in	
Angle of wrap-Driver sprocket:	151.9 degrees	Should be greater than 120 degrees
Angle of wrap-Driven sprocket:	208.1 degrees	

CHAIN DRIVE DESIGN

Initial Input Data:

Problem 42 - Multiple strands

Application: Rock Crusher
 Drive type: Hydraulic drive
 Driven machine: Rock Crusher
 Power input: 100 hp
 Service factor: 1.4
 Input speed: 625 rpm
 Desired output speed: 226.3 rpm

Table 7-1

Computed Data:

Design power: 140 hp
 Speed ratio: 2.78

Design Decisions-Chain Type and Teeth Numbers:

Number of strands:	4	1	2	3	4
Strand factor:	3.3	1.0	1.7	2.5	3.3

Required power per strand: 42.42 hp

Chain number: 80 Tables 7-7, 7-8 or 7-9

Chain pitch: 1.00 in

Number of teeth-Driver sprocket: 21 >42.94 hp per strand

Computed no. of teeth-Driven sprocket: 58.33

Enter Chosen number of teeth: 58 Check availability from vendor

Computed Data:

Actual output speed: 226.3 rpm
 Pitch diameter-Driver sprocket: 6.710 in
 Pitch diameter-Driven sprocket: 18.471 in

Center Distance, Chain Length and Angle of Wrap:

Enter Nominal center distance: 40 pitches 30 to 50 pitches recommended

Computed nominal chain length: 120.4 pitches

Enter Specified no. of pitches: 120 pitches Even number recommended

Actual chain length: 120.00 in

Computed actual center distance: 39.815 pitches

Actual center distance: 39.815 in

Angle of wrap-Driver sprocket: 163.0 degrees Should be greater than 120 degrees

Angle of wrap-Driven sprocket: 197.0 degrees

CHAPTER 8

KINEMATICS OF GEARS

Gear Geometry

1. $N = 44; P_d = 12$

a. $D = N/P_d = 44/12 = 3.667 \text{ in.}$	f. $b = 1.25/P_d = 1.25/12 = 0.1042 \text{ in.}$
b. $P_c = \pi/P_d = \pi/12 = 0.2618 \text{ in.}$	g. $C = 0.25/P_d = 0.25/12 = 0.0208 \text{ in.}$
c. $m = 25.4/P_d = 25.4/12 = 2.117 \text{ mm}$	h. $h_o = a+b = 2.25/P_d = 0.1875 \text{ in.}$
d. $m = 2.00 \text{ mm}$	i. $h_k = 2a = 2/P_d = 2/12 = 0.1667 \text{ in.}$
e. $a = 1/P_d = 1/12 = 0.0833 \text{ in.}$	j. $t = \pi/2P_d = \pi/(2(12)) = 0.131 \text{ in.}$
	k. $D_o = (N+2)/P_d = 46/12 = 3.833 \text{ in.}$

2. $N = 34; P_d = 24$

a. $D = 34/24 = 1.417 \text{ in.}$	f. $b = \frac{1.200}{P_d} + 0.002 = 0.0520 \text{ in.}$
b. $P_c = \pi/24 = 0.131 \text{ in.}$	g. $C = 0.1200/P_d + 0.002 = 0.0103 \text{ in.}$
c. $m = 25.4/24 = 1.058 \text{ mm}$	h. $h_o = a+b = 0.0417 + 0.0520 = 0.0937 \text{ in.}$
d. $m = 1.00 \text{ mm}$	i. $h_k = 2a = 2/24 = 0.0833 \text{ in.}$
e. $a = 1/24 = 0.0417 \text{ in.}$	j. $t = \pi/2(24) = 0.0654 \text{ in.}$
	k. $D_o = (N+2)/P_d = 36/24 = 1.500 \text{ in.}$

3. $N = 45; P_d = 2$

a. $D = 45/2 = 22.500 \text{ in.}$	f. $b = 1.25/2 = 0.625 \text{ in.}$
b. $P_c = \pi/2 = 1.571 \text{ in.}$	g. $C = 0.25/2 = 0.125 \text{ in.}$
c. $m = 25.4/2 = 12.7 \text{ mm}$	h. $h_o = 2.25/2 = 1.125 \text{ in.}$
d. $m = 12 \text{ mm}$	i. $h_k = 2/2 = 1.000 \text{ in.}$
e. $a = 1/2 = 0.500 \text{ in.}$	j. $t = \pi/2(2) = 0.7854 \text{ in.}$
	k. $D_o = 47/2 = 23.50 \text{ in.}$

4. $N = 18; P_d = 8$

a. $D = 18/8 = 2.250 \text{ in.}$	f. $b = 1.25/8 = 0.1563 \text{ in.}$
b. $P_c = \pi/8 = 0.3927 \text{ in.}$	g. $C = 0.25/8 = 0.0313 \text{ in.}$
c. $m = 25.4/8 = 3.175 \text{ mm}$	h. $h_o = 2.25/8 = 0.2813 \text{ in.}$
d. $m = 3.0 \text{ mm}$	i. $h_k = 2/8 = 0.250 \text{ in.}$
e. $a = 1/8 = 0.125 \text{ in.}$	j. $t = \pi/2(8) = 0.61963 \text{ in.}$
	k. $D_o = 20/8 = 2.500 \text{ in.}$

5. $N = 22; P_d = 1.75$

a. $D = 22/1.75 = 12.571 \text{ in.}$	f. $b = 1.25/1.75 = 0.7143 \text{ in.}$
b. $P_c = \pi/1.75 = 1.795 \text{ in.}$	g. $C = 0.25/1.75 = 0.1429 \text{ in.}$
c. $m = 25.4/1.75 = 14.514 \text{ mm}$	h. $h_o = 2.25/1.75 = 1.2857 \text{ in.}$
d. $m = 16 \text{ mm}$	i. $h_k = 2/1.75 = 1.1429 \text{ in.}$
e. $a = 1/1.75 = 0.5714 \text{ in.}$	j. $t = \pi/2(1.75) = 0.8976 \text{ in.}$
	k. $D_o = 24/1.75 = 13.714 \text{ in.}$

6. $N = 20; P_d = 64$

- $D = \frac{20}{64} = 0.3125 \text{ in.}$
- $P_c = \frac{\pi}{64} = 0.0491 \text{ in.}$
- $m = \frac{25.4}{64} = 0.397 \text{ mm}$
- $m = 0.40 \text{ mm}$
- $a = \frac{1}{64} = 0.0156 \text{ in.}$

- $b = \frac{1.200}{64} + 0.002 = 0.0208 \text{ in.}$
- $c = \frac{0.200}{64} + 0.002 = 0.0051 \text{ in.}$
- $h_t = a+b = 0.0364 \text{ in.}$
- $h_k = \frac{2}{64} = 0.0313 \text{ in.}$
- $t = \frac{\pi}{2(64)} = 0.0245 \text{ in.}$
- $D_o = \frac{d^2}{64} = 0.3438 \text{ in.}$

7. $N = 180; P_d = 80$

- $D = \frac{180}{80} = 2.250 \text{ in.}$
- $P_c = \frac{\pi}{80} = 0.0393 \text{ in.}$
- $m = \frac{25.4}{80} = 0.318 \text{ mm}$
- $m = 0.30 \text{ mm}$
- $a = \frac{1}{80} = 0.0125 \text{ in.}$

- $b = \frac{1.200}{80} + 0.002 = 0.0170 \text{ in.}$
- $c = \frac{0.200}{80} + 0.002 = 0.0045 \text{ in.}$
- $h_t = a+b = 0.0295 \text{ in.}$
- $h_k = \frac{2}{80} = 0.025$
- $t = \frac{\pi}{2(80)} = 0.0196 \text{ in.}$
- $D_o = \frac{d^2}{80} = 2.275 \text{ in.}$

8. $N = 28; P_d = 18$

- $D = \frac{28}{18} = 1.556 \text{ in.}$
- $P_c = \frac{\pi}{18} = 0.1745 \text{ in.}$
- $m = \frac{25.4}{18} = 1.411 \text{ mm}$
- $m = 1.5 \text{ mm}$
- $a = \frac{1}{18} = 0.0556 \text{ in.}$

- $b = \frac{1.25}{18} = 0.0694 \text{ in.}$
- $c = \frac{0.25}{18} = 0.0139 \text{ in.}$
- $h_t = \frac{2.25}{18} = 0.125 \text{ in.}$
- $h_k = \frac{2}{18} = 0.1111 \text{ in.}$
- $t = \frac{\pi}{2(18)} = 0.0873 \text{ in.}$
- $D_o = \frac{d^2}{18} = 1.667 \text{ in.}$

9. $N = 28; P_d = 20$

- $D = \frac{28}{20} = 1.400 \text{ in.}$
- $P_c = \frac{\pi}{20} = 0.1571 \text{ in.}$
- $m = \frac{25.4}{20} = 1.27 \text{ mm}$
- $m = 1.25 \text{ mm}$
- $a = \frac{1}{20} = 0.050 \text{ in.}$

- $b = \frac{1.200}{20} + 0.002 = 0.0620 \text{ in.}$
- $c = \frac{0.200}{20} + 0.002 = 0.012 \text{ in.}$
- $h_t = a+b = 0.1120 \text{ in.}$
- $h_k = \frac{2}{20} = 0.1000 \text{ in.}$
- $t = \frac{\pi}{2(20)} = 0.0785 \text{ in.}$
- $D_o = \frac{d^2}{20} = 1.500 \text{ in.}$

10. $N = 34; m = 3 = D/N$

- $D = mN = 3(34) = 102 \text{ mm}$
- $P_c = \frac{\pi D}{N} = \pi m = \pi/3 = 9.425 \text{ mm}$
- $P_d = \frac{25.4}{m} = 25.4/3 = 8.47$
- $P_d = 8$
- $a = m = 3.00 \text{ mm}$

- $b = 1.25m = 1.25(3) = 3.750 \text{ mm}$
- $c = 0.25m = 0.25(3) = 0.750 \text{ mm}$
- $h_t = a+b = 2.25m = 6.750 \text{ mm}$
- $h_k = 2a = 2m = 6.00 \text{ mm}$
- $t = \frac{P_c}{2} = \frac{\pi m}{2} = 4.712 \text{ mm}$
- $D_o = m(N+2) = 3(36) = 108 \text{ mm}$

11. $N = 45; m = 1.25$

- a. $D = mN = 1.25(45) = 56.25 \text{ mm}$
- b. $P_c = \pi m = \pi(1.25) = 3.927 \text{ mm}$
- c. $P_d = 25.4/m = 25.4/1.25 = 20.3$
- d. $P_d = 20$
- e. $a = m = 1.25 \text{ mm}$

- f. $b = 1.25(m) = 1.25(1.25) = 1.563 \text{ mm}$
- g. $C = 0.25m = 0.25(1.25) = 0.313 \text{ mm}$
- h. $h_t = 2.25m = 2.25(1.25) = 2.813 \text{ mm}$
- i. $h_k = 2m = 2(1.25) = 2.500 \text{ mm}$
- j. $t = P_c/2 = \pi m/2 = 1.963 \text{ mm}$
- k. $D_o = m(N+2) = 1.25(47) = 58.75 \text{ mm}$

12. $N = 12; m = 12$

NOTE: Maximum face width is the smallest of (a) or (b)

Given: $N_P = 18$; $N_G = 72$; $P_d = 12$; 20° pressure angle.

Computed values:

Gear ratio	$m_G = N_G/N_P = 72/18 = 4.000$
Pitch diameter: Pinion	$d = N_P/P_d = 18/12 = 1.500 \text{ in}$
Pitch diameter: Gear	$D = N_G/P_d = 72/12 = 6.000 \text{ in}$
Pitch cone angle: Pinion	$\gamma = \tan^{-1}(N_P/N_G) = \tan^{-1}(18/72) = 14.03^\circ$
Pitch cone angle: Gear	$\Gamma = \tan^{-1}(N_G/N_P) = \tan^{-1}(72/18) = 75.96^\circ$
Outer cone distance	$A_o = 0.5D/\sin(\Gamma) = 0.5(6.00 \text{ in})/\sin(75.96^\circ) = 3.092 \text{ in}$

Face width must be specified: $F = 0.800 \text{ in}$ Based on the following guidelines:

Nominal face width: $F_{nom} = 0.30 A_o = 0.30(3.092 \text{ in}) = 0.928 \text{ in}$

Maximum face width: $F_{max} = A_o/3 = (3.092 \text{ in})/3 = 1.031 \text{ in}$

or $F_{max} = 10/P_d = 10/12 = 0.833 \text{ in}$

Mean cone distance	$A_m = A_{mG} = A_o - 0.5F = 3.092 \text{ in} - 0.5(0.80 \text{ in}) = 2.692 \text{ in}$
Ratio (A_m/A_o)	$(2.692/3.092) = 0.871$ [This ratio occurs in several following calculations]
Mean circular pitch	$p_m = (\pi P_d)(A_m/A_o) = (\pi/12)(0.871) = 0.228 \text{ in}$
Mean working depth	$h = (2.00/P_d)(A_m/A_o) = (2.00/12)(0.871) = 0.145 \text{ in}$
Clearance	$c = 0.125h = 0.125(0.145 \text{ in}) = 0.018 \text{ in}$
Mean whole depth	$h_m = h + c = 0.145 \text{ in} + 0.018 \text{ in} = 0.163 \text{ in}$
Mean addendum factor	$c_l = 0.210 + 0.290/(m_G)^2 = 0.210 + 0.290/(4.00)^2 = 0.228$
Gear mean addendum	$a_G = c_l h = (0.228)(0.145 \text{ in}) = 0.033 \text{ in}$
Pinion mean addendum	$a_P = h - a_G = 0.145 \text{ in} - 0.033 \text{ in} = 0.112 \text{ in}$
Gear mean dedendum	$b_G = h_m - a_G = 0.163 \text{ in} - 0.033 \text{ in} = 0.130 \text{ in}$
Pinion mean dedendum	$b_P = h_m - a_P = 0.163 \text{ in} - 0.112 \text{ in} = 0.051 \text{ in}$
Gear dedendum angle	$\delta_G = \tan^{-1}(b_G/A_{mG}) = \tan^{-1}(0.130/2.692) = 2.76^\circ$
Pinion dedendum angle	$\delta_P = \tan^{-1}(b_P/A_{mG}) = \tan^{-1}(0.051/2.692) = 1.09^\circ$
Gear outer addendum	$a_{oG} = a_G + 0.5F \tan \delta_G$
	$a_{oG} = (0.033 \text{ in}) + (0.5)(0.80 \text{ in}) \tan(2.76^\circ) = 0.0406 \text{ in}$
Pinion outer addendum	$a_{oP} = a_P + 0.5F \tan \delta_G$
	$a_{oP} = (0.112 \text{ in}) + (0.5)(0.80 \text{ in}) \tan(2.76^\circ) = 0.1313 \text{ in}$
Gear outside diameter	$D_o = D + 2a_{oG} \cos \Gamma$
	$D_o = 6.000 \text{ in} + 2(0.0406 \text{ in}) \cos(75.96^\circ) = 6.020 \text{ in}$
Pinion outside diameter	$d_o = d + 2a_{oP} \cos \gamma$
	$d_o = 1.500 \text{ in} + 2(0.1313 \text{ in}) \cos(14.04^\circ) = 1.755 \text{ in}$

EXAMPLE PROBLEM 51

GIVEN DATA

No. of teeth in pinion	16
No. of teeth in gear	48
Diametral pitch	16
Pressure angle	20 degrees

COMPUTED VALUES

Gear ratio	3.000
Pitch diameter: Pinion	2.000 in
Pitch diameter: Gear	6.000 in
Pitch cone angle: Pinion	18.435 degrees
Pitch cone angle: Gear	71.565 degrees
Outer cone distance	3.162 in
Nominal face width	0.949 in
Maximum face width (a)	1.054 in
Maximum face width (b)	1.250 in
INPUT Face width	1.000 in

Mean cone distance	2.662 in
Ratio A_m/A_o	0.842
Mean circular pitch	0.331 in
mean working depth	0.210 in
Clearance	0.026 in
Mean whole depth	0.237 in
mean addendum factor	0.242
Gear mean addendum	0.051 in
Pinion mean addendum	0.159 in
Gear mean dedendum	0.186 in
Pinion mean dedendum	0.077 in
Gear dedendum angle	3.992 degrees
Pinion dedendum angle	1.663 degrees
Gear outer addendum	0.065 in
Pinion outer addendum	0.194 in
Gear outside diameter	6.041 in
Pinion outside diameter	2.369 in

NOTE: Maximum face width is the smallest of (a) or (b).

Wormgearing

52

$$\text{WORM GEARING} : D_w = 1.250 \text{ IN}, N_w = 1, P_d = 10; \phi_a = 14.5^\circ$$

$$N_G = 40; F = 0.625 \text{ IN.}$$

$$\text{LEAD} = \text{AXIAL PITCH} = \text{CIRCULAR PITCH} = \frac{\pi}{P_d} = \frac{\pi}{10} = 0.3142 \text{ IN.}$$

$$\text{LEAD ANGLE} = \lambda = \tan^{-1} \left(\frac{L}{\pi D_w} \right) = \tan^{-1} \left(\frac{0.3142}{\pi (1.250)} \right) = 4.57^\circ$$

$$\text{ADDENDUM} = a = \frac{1}{P_d} = \frac{1}{10} = 0.100 \text{ IN.}; \text{DEDENDUM} = \frac{1.157}{P_d} = 0.1157 \text{ IN.}$$

$$\text{WORM OUTSIDE DIA.} = D_o \text{ IN.} = D_w + 2a = 1.250 + 2(0.100) = 1.450 \text{ IN.}$$

$$\text{WORM ROOT DIA.} = D_{rw} \text{ IN.} = D_w - 2a = 1.250 - 2(0.1157) = 1.0186 \text{ IN.}$$

$$\text{GEAR PITCH DIA.} = D_g = N_g / P_d = 40 / 10 = 4.000 \text{ IN.}$$

$$\text{CENTER DISTANCE} = C = (D_g + D_w) / 2 = (4.000 + 1.250) / 2 = 2.625 \text{ IN.}$$

$$\text{VELOCITY RATIO} = V_r = N_g / N_w = 40 / 1 = 40$$

NOTE: On the following two pages are the results of Problems 52-57 giving pertinent geometric properties of worms and wormgears and their velocity ratios. The detailed calculations follow the pattern illustrated above for Problem 52. The equations come from Section 8-9, Equations 8-20 to 8-25.

Compare the results to discern how variations in geometry such as diametral pitch and the number of threads in the worm affect the overall results. This is especially pertinent to Problem 53 in which three different designs for worm/wormgear sets provide the same velocity ratio. The single threaded worm produces the smallest center distance and overall size of the reducer. But note, also, that it has the smallest lead angle. The lead angle increases as the number of threads is increased. On the positive side, the small lead angle makes the reducer self-locking. On the negative side, the small lead angle results in lower mechanical efficiency as will be shown in Chapter 10, Section 10-11. The designer must balance these advantages and disadvantages for each application.

WORMGEARING **PROBLEM: 52**
INPUT DATA

Worm pitch diameter = 1.250 in
 Diametral pitch = 10
 No. of worm threads = 1
 No. of gear teeth = 40
 Face width of gear = 0.625 in

COMPUTED RESULTS

Circular pitch of gear = 0.3142 in

Gear Trains - Analysis

FOR PROBLEM 58 - ASSUME THAT THE INPUT SHAFT ROTATES CLOCKWISE.

58

TRAIN VALUE = $TV = m_1/m_6$; $m_1 = 3450 \text{ RPM}$

$$TV = \frac{N_B}{N_A} \cdot \frac{N_D}{N_C} \cdot \frac{N_E}{N_E} \cdot \frac{N_H}{N_G} \cdot \frac{N_G}{N_H} = \frac{-82}{18} \frac{64}{17} \frac{110}{20} \frac{18}{18} \frac{38}{18} = -119.1$$

$$m_6 = \frac{m_1}{TV} = \frac{3450 \text{ RPM}}{-119.1} = -17.32 \text{ RPM} \quad \text{COUNTERCLOCKWISE}$$

GEAR H IS AN IDLER. IT DOES NOT AFFECT THE TV BUT CHANGES THE DIRECTION OF THE OUTPUT SHAFT.

59

$m_1 = 12200 \text{ RPM}$; FIND m_5 : $TV = m_1/m_5$

$$TV = \frac{N_B}{N_A} \frac{N_D}{N_C} \frac{N_E}{N_E} \frac{N_H}{N_G} = \frac{50}{12} \frac{40}{12} \frac{60}{12} \frac{72}{2} = 30000$$

$$m_5 = \frac{m_1}{TV} = \frac{12200 \text{ RPM}}{30000} = 0.4067 \text{ RPM}$$

60

$m_1 = 6840 \text{ RPM}$; FIND m_4 : $TV = m_1/m_4$

$$TV = \frac{N_B}{N_A} \frac{N_D}{N_C} \frac{N_E}{N_E} = \frac{48}{16} \frac{48}{18} \frac{60}{12} = 40 \text{ EXACTLY}$$

$$m_4 = \frac{m_1}{TV} = \frac{6840}{40} = 171 \text{ RPM EXACTLY}$$

61

$m_1 = 2875 \text{ RPM}$; FIND m_4 : $TV = m_1/m_4$

$$TV = \frac{N_B}{N_A} \frac{N_D}{N_C} \frac{N_E}{N_E} = \frac{100}{3} \frac{80}{2} \frac{85}{20} = 5666.7$$

$$m_4 = \frac{m_1}{TV} = \frac{2875 \text{ RPM}}{5666.7} = 0.5074 \text{ RPM}$$

66

DESIGN: $M_{IN} = 1800 \text{ RPM}$ $M_{OUT} = 2 \text{ RPM}$ EXACT RATIO REQ'D.
 $TV = 1800/2 = 900$ EXACT; USE FACTORING: $N_{MAX} = 150$

$$\begin{array}{r} 2 | 900 \\ 2 | 450 \\ 5 | 225 \\ 5 | 45 \\ 3 | 9 \\ 3 \end{array}$$

FACTORS ARE: 2-2-5-3-3
SEE TABLE 8-6 FOR INTERFERENCE DATA
FOR 20° F.D. TEETH USE $N_{MIN} = 16$ OR 17
NOMINAL VR_{MAX} PER PAIR = $150/17 = 8.82$ TOO SMALL
TWO PAIRS: $(8.82)^2 = 77.8$ SMALL
THREE PAIRS: $(8.82)^3 = 687$ SMALL
FOUR PAIRS: $(8.82)^4 = 6661$ REQ'D.

RECOMBINE FACTORS: $VR_1 = 6$, $VR_2 = 6$, $1:3 = 5$, $VR_4 = 5$

67

DESIGN: $M_{IN} = 1800 \text{ RPM}$ EXACT; $21 \leq M_{OUT} \leq 22$; $N_{MAX} = 150$ 8 20° F.D.
 $TV_{MAX} = 1800/21.5 = 83.7$ $TV_{MIN} = 1800/22 = 81.8$ $TV_{MAX} = 1800/21 = 85.7$
FROM TABLE 8-6, NO INTERFERENCE WITH $N_p \geq 17$ FOR 20° F.D. TEETH
 VR_{MAX} PER PAIR = $150/17 = 8.82$ SMALL; TWO PAIRS $VR_{MAX} = (8.82)^2 = 77.9$ LOW
LAYOUT AS IN FIG. 8-31 IN TEXT - TRIPLE REDUCTION.
TRY EQUAL REDUCTION RATIO: $VR_1 = VR_2 = VR_3 = \sqrt[3]{83.7} = 4.37$
LET $N_A = N_C = N_E = 17$: LET $VR_1 = 5$, $VR_2 = 4$: THEN $VR_3 = 83.7/20 = 4.19$
 $N_F = (17)(4.19) = 71.2 \Rightarrow$ SPECIFY $N_F = 71$

$$\text{FINAL } TV = \frac{85}{17} \cdot \frac{68}{17} \cdot \frac{71}{17} = 83.53 \quad M_{OUT} = \frac{M_{IN}}{TV} = \frac{1800}{83.53} = 21.55 \text{ RPM} \quad \underline{\text{OK}}$$

68

DESIGN: $M_{IN} = 3360 \text{ RPM}$ EXACT; $M_{OUT} = 12 \text{ RPM}$ EXACT; $N_{MAX} = 150$
20° F.D. TEETH. FROM TABLE 8-6 LET $N_{MIN} = 17$ FOR NO INTERFERENCE
 VR_{MAX} PER PAIR = $150/17 = 8.82$; 2 PAIRS $VR_{MAX} = (8.82)^2 = 77.8$; 3 PAIRS = 686
 $TV = \frac{3360}{12} = 280$ EXACT; USE 3 PAIRS SIMILAR TO FIG 8-31 IN TEXT

FACTORING: $2 | 280$ $2 \cdot 2 \cdot 5 \cdot 2 \cdot 7 = 280$. RECOMBINE 8-7-5 = 280

$2 140$	$VR_1 = 8 : N_A = 17, N_B = 136$
$5 70$	$VR_2 = 7 : N_C = 17, N_D = 119$
$2 14$	$VR_3 = 5 : N_E = 17, N_F = 85$
7	

$$TV = \frac{136}{17} \cdot \frac{119}{17} \cdot \frac{85}{17} = 280 \text{ EXACTLY}$$

(OTHER DESIGNS POSSIBLE)

69

DESIGN: $M_{IN} = 4200 \text{ RPM}$ EXACTLY: $13.0 < M_{OUT} < 13.5 \text{ RPM}$: Positive TV

$$TV_{MIN} = \frac{4200}{13.5} = 311.1 \approx TV_{NOM} = \frac{4200}{13.25} = 316.98 : TV_{MAX} = \frac{4200}{13.0} = 323.08$$

FROM PROB 6B, 3 PAIRS REQ'D. LAYOUT IN FIG 8-31 PRODUCES A NEGATIVE TV. USE IDLER IN ANY PAIR.

TRY RESIDUAL RATIO METHOD. NOMINAL VR = $\sqrt{317} = 6.82$ PER PAIR

$$\text{TRY } VR_1 = 7 : VR_2 = 6 : \text{ THEN } VR_3 \approx 317/42 \approx 7.55 : \text{ USE } VR_3 = 7.50$$

$$\text{FINAL } TV = VR_1 \cdot VR_2 \cdot VR_3 = (7)(6)(7.50) = 315 \text{ OK}$$

IT IS PREFERRED TO PLACE HIGHER RATIOS EARLY IN THE TRAIN. LET $VR_1 = 7.5$, $VR_2 = 7$, $VR_3 = 6$.

$$\text{LET } N_A = 18 ; N_B = 7.5(18) = 135 ; \text{ LET } N_C = 17, N_D = 7(17) = 119$$

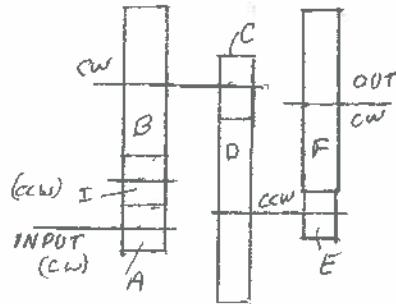

$$\text{LET } N_E = 17, N_F = 17(6) = 102.$$

IDLER NEEDED FOR POSITIVE TRAIN

LET $N_I = 17$. PLACE IN FIRST PAIR,
FINAL TRAIN VALUE:

$$TV = \frac{135}{18} \times \frac{119}{17} \times \frac{102}{17} = 315$$

$$M_{OUT} = \frac{M_{IN}}{TV} = \frac{4200}{315} = 13.33 \text{ RPM} \text{ OUT}$$

NOTE: CHAPTER 9 GIVES INFORMATION ON SELECTION OF P_d -DIAMETRAL PITCH. BECAUSE OF SPEED/TORQUE CHANGES, $P_{d1} > P_{d2} > P_{d3}$, LARGER P_d GIVES SMALLER GEARS. THIS IS THE REASON THAT LARGER RATIOS SHOULD BE PLACED EARLIER IN THE TRAIN.

70

DESIGN: $M_{IN} = 5500 \text{ RPM}$ EXACTLY:

$$221 < M_{OUT} < 225$$

DESIGN: TWO DOUBLE REDUCTION WITH ALL EXTERNAL GEARS

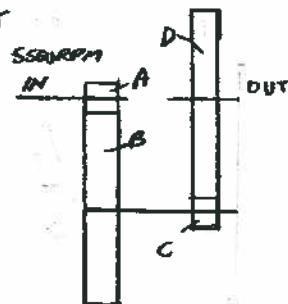

$$TV_{MAX} = \frac{5500}{221} = 24.88 : TV_{MIN} = \frac{5500}{225} = 24.44 : TV_{NOM} = \frac{5500}{223} = 24.66$$

NOMINAL RATIO FOR EACH PAIR = $\sqrt{24.66} = 4.97$. TRY $VR_1 = 5$

THEN $VR_2 \approx 24.66/5 = 4.93$: FOR $N_F = 16$ $N_A = 78.9$ - USE $N_A = 79$

$$\text{FINAL } TV_1 = \frac{N_B}{N_A} \cdot \frac{N_D}{N_C} = \frac{80}{79} \cdot \frac{79}{16} = 24.6875$$

$$M_{OUT} = \frac{5500}{TV_1} = 222.78 \text{ RPM OK}$$

71

DESIGN: $M_{IN} = 5500 \text{ RPM}$ $13.0 < M_{OUT} < 14.0 \text{ RPM}$

$$TV_{NOM} = 5500/13.5 = 407.4$$

SKETCH AS IN 70.

$$\text{MAX RATIO FOR ONE PAIR} = 150/17 = 8.82$$

TWO PAIRS - MAX = 77.85; THREE PAIRS 687 - OK

$$\text{NOMINAL RATIO PER PAIR: } \sqrt[3]{407.4} = 7.41$$

TRY $VR_1 = 8$, $VR_2 = 8$ - BUT USE HUNTING TOOTH APPROACH.

$$VR = 8: N_A = 17, N_B = 17(8) = 136: \underline{\text{USE } N_B = 125}$$

SAME FOR N_C, N_D .

$$(VR_1)(VR_2) = \left(\frac{125}{17}\right)^2 = 7.94^2 = 63.06$$

$$\text{RESIDUAL RATIO: } 407.4 / 63.06 = 6.46 = N_F / N_E$$

LET $N_E = 17$; $N_F = 6.46(17) = 109.82 \Rightarrow \text{USE 110 TEETH}$

$$\text{FINAL TV} = \frac{135}{17} \times \frac{135}{17} \times \frac{110}{17} = 408.05$$

$$\text{FINAL OUTPUT SPEED} = 5500/408.05 = 13.48 \text{ RPM - OK}$$

72

DESIGN: $M_{IN} = 1750$; $146 < M_{OUT} < 150$

$$TV_{NOM} = 1750/148 = 11.82$$

$$\text{LET } VR_1 = N_B/N_A = 75/18 = 4.167$$

$$\text{RESIDUAL RATIO} = 11.82/4.167 = 2.837$$

$$\text{LET } N_C = 18: N_D = 18(2.837) = 51.06 \Rightarrow 51$$

$$N_A = 18, N_B = 75, N_C = 18, N_D = 51$$

$$M_{OUT} = 1750 \times \frac{18}{75} \times \frac{18}{51} = 148.2 \text{ RPM OK}$$

SKETCH SAME AS 71 WITH ONLY TWO PAIRS

[THESE RESULTS USED IN PROBLEM 9-74.]

73

DESIGN: $M_{IN} = 850 \text{ RPM}$; $40 < M_{OUT} < 44$; USE 2 PAIRS

$$TV_{NOM} = 850/42 = 20.24, \text{ LET } VR_1 = N_B/N_A = 81/18 = 4.50$$

$$\text{RESIDUAL RATIO} = VR_2 = 20.24/4.50 = 4.50: \underline{N_C = 18, N_D = 81}$$

$$M_{OUT} = 850 \times \frac{18}{81} \times \frac{18}{81} = 41.98 \text{ RPM OK}$$

[THESE RESULTS USED IN PROBLEM 9-75.]

74

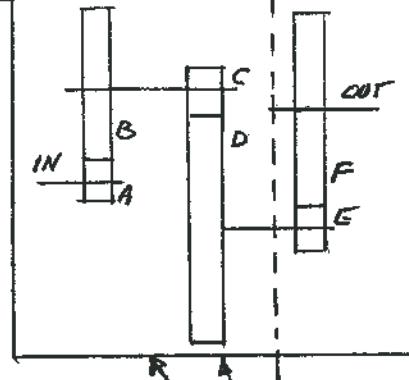

DESIGN: USE TWO PAIRS; $M_{IN} = 3000 \text{ RPM}$; $548 < M_{OUT} < 552$

$$TV_{NOM} = 3000/550 = 5.4545; \text{ LET } VR_1 = VR_2 = \sqrt{5.4545} \approx 2.335$$

$$\text{LET } N_A = 15; N_B = 15(2.335) = 35.03 \Rightarrow 35. \text{ LET } N_C = 15, N_D = 35$$

$$M_{OUT} = 3000 \times \frac{15}{35} \times \frac{15}{35} = 551 \text{ RPM OK}$$

[THESE RESULTS USED IN PROBLEM 9-76.]

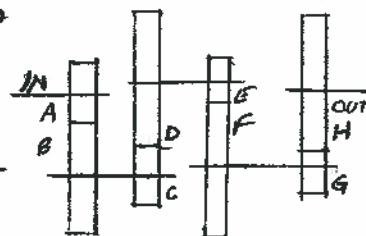

75

DESIGN: $n_{in} = 3600 \text{ RPM}$ $3.0 < n_{out} < 6.0$

$$TV_{Nom} = 3600/4.0 = 900 : \text{USE 4 PAIRS}$$

FACT RINGS:	2 900	USE $VR_1 = 6 = 96/16 = N_B/N_A$
	2 450	$VR_2 = 6 = 96/16 = N_D/N_C$
	5 225	$VR_3 = 5 = 80/16 = N_E/N_E$
	5 45	$VR_4 = 5 = 80/16 = N_H/N_G$
	3 9	
	3	

ALTERNATE SOLUTION USING HUNTING TOOTH:

$$\text{LET } N_A = N_C = N_E = N_G = 16. \text{ LET } N_B = N_D = 95. \text{ LET } N_F = 81$$

$$VR_1 = VR_2 = 95/16 = 5.9375; VR_3 = 81/16 = 5.0625$$

$$VR_1 \times VR_2 \times VR_3 = 178.47, \text{ RESIDUAL RATIO} = 900/178.47 = 5.0643$$

$$\text{LET } N_H = 81. VR_4 = VR_3 = 81/16 = 5.0625$$

$$\text{TOTAL TV} = (178.47)(5.0625) = 903.5$$

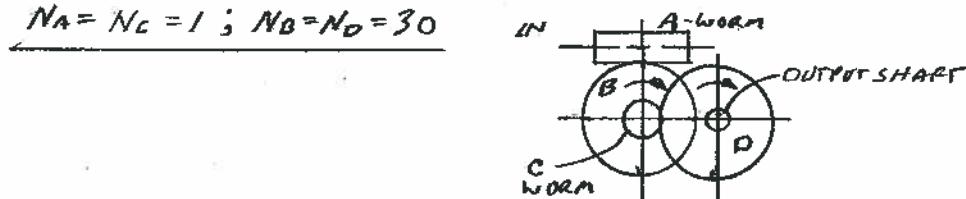

$$\text{FINAL } n_{out} = 3600/903.5 = 3.984 \text{ RPM OK}$$

76

DESIGN: $n_{in} = 3600$ $3.0 < n_{out} < 6.0 \text{ RPM}$

$$TV_{Nom} = 3600/4.0 = 900 : \text{USE TWO PAIRS OF WORM/WORMGEARS}$$

$$N_A = N_C = 1; N_B = N_D = 30$$

77

DESIGN: $n_{in} = 1800 \text{ RPM}$ $n_{out} = 8.0 \text{ EXACTLY}$

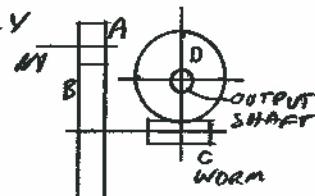

LET $VR_2 = 50$ - WORM GEAR DRIVE.

$$TV = 1800/8 = 225: VR_1 = 225/50 = 4.50$$

HELCICAL GEARS

$$\text{LET } N_A = 16, N_B = 72, N_C = 1, N_D = 50$$

$$n_{out} = 1800 \times \frac{16}{72} \times \frac{1}{50} = 8.0 \text{ RPM}$$

78

DESIGN: $n_{in} = 3360 \text{ RPM}$. $n_{out} = 12.0 \text{ EXACTLY}$,

USE TWO PAIRS OF WORM GEAR DRIVES AS IN PROBLEM 76.

$$\text{LET } VR_1 = 20, VR_2 = 14: N_A = 2, N_B = 40, N_C = 2, N_D = 28.$$

79

DESIGN! $M_{IN} = 4200 \text{ RPM}$, $13.0 < M_{OUT} < 13.5$

USE COMBINED HELICAL WITH WORM GEAR AS IN PROBLEM 77.

LET $VR_2 = 50$. WORM GEAR DRIVE, $N_c = 1, N_D = 50$

$$TV_{NOM} = 4200/13.25 = 316.98, VR_1 = 316.98/50 = 6.34$$

$$\text{LET } N_A = 18, N_B = 18(6.34) = 114.1 \Rightarrow \text{USE } 114 = N_B$$

$$\text{FINAL OUTPUT SPEED} = 4200 \times \frac{18}{114} \times \frac{1}{50} = 13.26 \text{ RPM OK}$$

80,

DESIGN! $M_{IN} = 5500 \text{ RPM}$ $13.0 < M_{OUT} < 14.0 \text{ RPM}$

USE TWO WORM GEAR DRIVES AS IN PROBLEM 76.

$$TV_{NOM} = 5500/13.5 = 407.4$$

$$\text{LET } VR_1 = 20, \text{ THEN } VR_2 = 407.4/20 = 20.37$$

$$\text{TRY } N_c = 3, N_D = 3(20.37) = 61.11 \Rightarrow \text{USE } 61$$

$$N_A = 3, N_B = 60, N_c = 3, N_D = 61$$

$$\text{FINAL OUTPUT SPEED} = 5500 \times \frac{3}{60} \times \frac{3}{61} = 13.52 \text{ RPM OK}$$

$$\text{CAN ALSO USE } N_D = 62, \text{ THEN } M_{OUT} = 13.30 \text{ RPM}$$

$$N_D = 60, \text{ THEN } M_{OUT} = 13.75 \text{ RPM}$$

CHAPTER 9

SPUR GEAR DESIGN

Forces on Spur Gear Teeth

1 GIVEN: $\phi = 20^\circ$, $P = 7.5 \text{ IN}$, $M_P = 1750 \text{ RPM}$, $N_P = 20$, $N_G = 72$, $P_d = 12$

$$a) M_G = M_P \cdot \frac{N_P}{N_G} = 1750 \text{ RPM} \cdot \frac{20}{72} = 486.1 \text{ RPM}$$

$$b) VR = m_G = N_G/N_P = 72/20 = 3.600$$

$$c) D_P = N_P/P_d = 20/12 = 1.667 \text{ IN}; D_G = N_G/P_d = 72/12 = 6.000 \text{ IN}$$

$$d) C = \frac{N_P + N_G}{2 P_d} = \frac{20 + 72}{2(12)} = 3.833 \text{ IN}$$

$$e) N_t = \pi D_P M_P / 12 = \pi (1.667)(1750) / 12 = 764 \text{ FT/MIN}$$

$$f) T_P = \frac{63000 (P)}{M_P} = \frac{63000 (7.5)}{1750} = 270 \text{ LB-IN}$$

$$T_G = \frac{63000 (P)}{M_G} = \frac{63000 (7.5)}{486.1} = 972 \text{ LB-IN}$$

$$g) W_t = \frac{T_P}{D_P/2} = \frac{270 \text{ LB-IN}}{1.667 \text{ IN}/2} = 324 \text{ LB}$$

$$\text{OR } W_b = \frac{33000 (P)}{N_t} = \frac{33000 (7.5)}{764} = 324 \text{ LB}$$

$$h) W_R = W_t \tan \phi = (324 \text{ LB}) \tan 20^\circ = 118 \text{ LB}$$

$$i) W_N = W_t / \cos \phi = 324 \text{ LB} / \cos 20^\circ = 345 \text{ LB}$$

A SIMILAR METHOD IS USED FOR PROBLEMS 2-6.

SPREADSHEET SOLUTIONS ARE SHOWN ON THE FOLLOWING PAGES. THE SOLUTION FOR PROBLEM 1 IS ALSO SHOWN FOR COMPARISON TO THE SOLUTION SHOWN ABOVE.

Forces on Spur Gear Teeth

Problem 1	Pressure angle =	20	degrees
Chapter 9	Power =	7.5	hp
	pinion speed =	1750	rpm
	teeth in pinion =	20	
	teeth in gear =	72	
	center distance =	12	

RESULTS:

a	Gear speed =	486.1	rpm
b	VR = m_G =	3.600	
c	pinion PD =	1.667	in
	gear PD =	6.000	in
d	center distance = C =	3.833	in
e	pitch line speed =	764	ft/min
f	torque on pinion shaft =	270	lb in
	torque on gear shaft =	972	lb in
g	tangential force =	324	lb
h	radial force =	118	lb
i	normal force =	345	lb

Problem 2	Pressure angle =	20	degrees
Chapter 9	Power =	50	hp
	pinion speed =	1450	rpm
	teeth in pinion =	18	
	teeth in gear =	63	
	center distance = C =	5	

RESULTS:

a	Gear speed =	304.4	rpm
b	VR = m_G =	3.778	
c	pinion PD =	3.600	in
	gear PD =	13.600	in
d	center distance = C =	8.600	in
e	pitch line speed =	1084	ft/min
f	torque on pinion shaft =	2739	lb in
	torque on gear shaft =	10348	lb in
g	tangential force =	1522	lb
h	radial force =	554	lb
i	normal force =	1620	lb

Forces on Spur Gear Teeth

Problem 3
Chapter 9

Pressure angle =	20	degrees
Power =	0.75	hp
pinion speed =	3450	rpm
teeth in pinion =	24	
teeth in gear =	110	
pitch/pitch =	25	

RESULTS:

a	Gear speed =	752.7	rpm
b	VR = m_G =	4.583	
c	pinion PD =	1.000	in
	gear PD =	4.583	in
d	center distance = C =	2.792	in
e	pitch line speed =	903	ft/min
f	torque on pinion shaft =	13.70	lb in
	torque on gear shaft =	62.77	lb in
g	tangential force =	27.40	lb
h	radial force =	9.97	lb
i	normal force =	29.16	lb

Problem 4
Chapter 9

Pressure angle =	25	degrees
Power =	7.5	hp
pinion speed =	1750	rpm
teeth in pinion =	20	
teeth in gear =	72	
pitch/pitch =	17	

RESULTS:

a	Gear speed =	486.1	rpm
b	VR = m_G =	3.600	
c	pinion PD =	1.667	in
	gear PD =	6.000	in
d	center distance = C =	3.833	in
e	pitch line speed =	764	ft/min
f	torque on pinion shaft =	270	lb in
	torque on gear shaft =	972	lb in
g	tangential force =	324	lb
h	radial force =	151	lb
i	normal force =	358	lb

Forces on Spur Gear Teeth

Problem 5	Pressure angle =	25	degrees
Chapter 9	Power =	50	hp
	pinion speed =	1500	rpm
	teeth in pinion =	18	
	teeth in gear =	68	
	diametral pitch =	5	

RESULTS:

a	Gear speed =	304.4	rpm
b	VR = m_G =	3.778	
c	pinion PD =	3.600	in
	gear PD =	13.600	in
d	center distance = C =	8.600	in
e	pitch line speed =	1084	ft/min
f	torque on pinion shaft =	2739	lb in
	torque on gear shaft =	10348	lb in
g	tangential force =	1522	lb
h	radial force =	710	lb
i	normal force =	1680	lb

Problem 6	Pressure angle =	25	degrees
Chapter 9	Power =	0.75	hp
	pinion speed =	3450	rpm
	teeth in pinion =	24	
	teeth in gear =	110	
	diametral pitch =	24	

RESULTS:

a	Gear speed =	752.7	rpm
b	VR = m_G =	4.583	
c	pinion PD =	1.000	in
	gear PD =	4.583	in
d	center distance = C =	2.792	in
e	pitch line speed =	903	ft/min
f	torque on pinion shaft =	13.70	lb in
	torque on gear shaft =	62.77	lb in
g	tangential force =	27.40	lb
h	radial force =	12.78	lb
i	normal force =	30.24	lb

Gear Manufacture and Quality

7. See Section 9-4. Form milling, shaping, hobbing, grinding.

For Problems 8-16, refer to Section 9-5 and Table 9-3 for recommended quality numbers in the A_v system according to AGMA Standard 2015. Grain harvester: $A_v = 10$.

8. Grain harvester: $A_v = 10$.
9. Printing press: $A_v = 7$.
10. Auto transmission: $A_v = 6$.
11. Gyroscope: $A_v = 2$.
12. Analytical quality measurements include *index variation, tooth alignment, tooth profile, root radius, and runout*.
13. AGMA Standard 2015 is currently used. See Table 9-2 for the range of quality numbers in this system and the comparisons with prior systems.

For Problems 14-16, for precision machinery, use the recommendations for machine tool drives in the lower part of Table 9-3. The choice of quality number is based on the pitch line speed of the gears.

14. (From Problem 1). Pitch line speed = 764 ft/min Use $A_v = 10$.
15. (From Problem 2). Pitch line speed = 1084 ft/min Use $A_v = 8$.
16. (From Problem 3). Pitch line speed = 903 ft/min Use $A_v = 8$.

Gear Materials

Answers for Problems 17 – 25 are found in Sections 9-6 and 9-7. Only brief statements are given here.

17. Bending stresses are created by the tangential force on the gear teeth acting in a manner similar to that on a cantilever. The maximum bending stress occurs in the root of the tooth where it blends with the involute tooth form. High levels of contact stress, called Hertz stress, occur in the face of the teeth near the pitch line as forces are exerted between the pinion and the gear teeth. The probable mode of failure is pitting of the tooth surface.
18. AGMA standards give allowable bending stress numbers and allowable contact stress numbers related to the hardness of the material of the teeth. See Figures 9-11 and 9-12.
19. Gear steels are typically medium carbon plain or alloy steels that are heat treated by through-hardening using a quenching and tempering process. For examples, see Table 9-4, Section 9-7.
20. The AGMA recommends hardness values from HB 180 to HB 400. See Figures 9-11 and 9-12.
21. Grade 1 steel is typical commercial quality and is recommended for use in this book. Grades 2 and 3 require progressively more stringent quality controls on the alloy content and cleanliness of the materials. Cost increases dramatically for the higher grades. See AGMA Standard 2004-C08 or the latest revision.
22. Grades 2 and 3 may be specified for high-speed aerospace applications, turbine engine driven systems, ship propulsion drives, and high-capacity industrial drives such as those in steel rolling mills.

23. Case hardening by flame hardening, induction hardening, and carburizing are three processes that produce harder surfaces than typical through-hardening.
24. See AGMA Standard 2001-D04 or the latest revision.
25. AGMA Standard 2001-D04 provides data for gray cast iron, ductile iron, and bronze. Table 9-6.
26. From Figures 9-11 and 9-12:
- Grade 1; 200 HB: $s_{at} = 28.26 \text{ ksi}$; $s_{ac} = 93.50 \text{ ksi}$ – U.S.: $s_{at} = 194.9 \text{ MPa}$; $s_{ac} = 644.6 \text{ MPa}$ – SI
 - Grade 1; 300 HB: $s_{at} = 36.0 \text{ ksi}$; $s_{ac} = 125.7 \text{ ksi}$ – U.S.: $s_{at} = 248.1 \text{ MPa}$; $s_{ac} = 866.6 \text{ MPa}$ – SI
 - Grade 1; 400 HB: $s_{at} = 43.72 \text{ ksi}$; $s_{ac} = 157.9 \text{ ksi}$ – U.S.: $s_{at} = 301.5 \text{ MPa}$; $s_{ac} = 1088.6 \text{ MPa}$ – SI
 - Using HB > 400 is not recommended.
 - Grade 2; 200 HB: $s_{at} = 36.80 \text{ ksi}$; $s_{ac} = 104.1 \text{ ksi}$ – U.S.: $s_{at} = 253.7 \text{ MPa}$; $s_{ac} = 718.5 \text{ MPa}$ – SI
 - Grade 2; 300 HB: $s_{at} = 47.0 \text{ ksi}$; $s_{ac} = 139.0 \text{ ksi}$ – U.S.: $s_{at} = 324.0 \text{ MPa}$; $s_{ac} = 959.5 \text{ MPa}$ – SI
 - Grade 2; 400 HB: $s_{at} = 57.20 \text{ ksi}$; $s_{ac} = 173.9 \text{ ksi}$ – U.S.: $s_{at} = 394.3 \text{ MPa}$; $s_{ac} = 1200.5 \text{ MPa}$ – SI
27. From Figure 9-11: Grade 1: 300 HB. Grade 2: 192 HB
28. From Table 9-5: Case hardening by carburizing produces 55-64 HRC
29. From Appendix 5: SAE 1020, 4118, 8620, and others
30. From Table 9-5: Flame or induction hardening produces 50-54 HRC with materials having high hardenability
31. SAE 4140, 4340, 6150. All have good hardenability
32. ASTM A536, Grade 80-55-06 has a minimum hardness of 179 HB.
33. a. $s_{at} = 45.0 \text{ ksi}$; $s_{ac} = 170.0 \text{ ksi}$ – U.S.: $s_{at} = 310 \text{ MPa}$; $s_{ac} = 1172 \text{ MPa}$ – SI [Table 9-5]
b. $s_{at} = 45.0 \text{ ksi}$; $s_{ac} = 175.0 \text{ ksi}$ – U.S.: $s_{at} = 310 \text{ MPa}$; $s_{ac} = 1207 \text{ MPa}$ – SI [Table 9-5]
c. $s_{at} = 55.0 \text{ ksi}$; $s_{ac} = 180.0 \text{ ksi}$ – U.S.: $s_{at} = 379 \text{ MPa}$; $s_{ac} = 1241 \text{ MPa}$ – SI [Table 9-5]
d. Not listed
e. $s_{at} = 55.0 \text{ ksi}$; $s_{ac} = 180.0 \text{ ksi}$ – U.S.: $s_{at} = 379 \text{ MPa}$; $s_{ac} = 1241 \text{ MPa}$ – SI [Table 9-5]
f. $s_{at} = 5.00 \text{ ksi}$; $s_{ac} = 50.0 \text{ ksi}$ – U.S.: $s_{at} = 35.0 \text{ MPa}$; $s_{ac} = 345 \text{ MPa}$ – SI [Table 9-6]
g. $s_{at} = 13.0 \text{ ksi}$; $s_{ac} = 75.0 \text{ ksi}$ – U.S.: $s_{at} = 90.0 \text{ MPa}$; $s_{ac} = 517 \text{ MPa}$ – SI [Table 9-6]
h. $s_{at} = 27.0 \text{ ksi}$; $s_{ac} = 92.0 \text{ ksi}$ – U.S.: $s_{at} = 186 \text{ MPa}$; $s_{ac} = 634 \text{ MPa}$ – SI [Table 9-6]
i. $s_{at} = 5.70 \text{ ksi}$; $s_{ac} = 30.0 \text{ ksi}$ – U.S.: $s_{at} = 39.0 \text{ MPa}$; $s_{ac} = 207 \text{ MPa}$ – SI [Table 9-6]
j. $s_{at} = 23.6 \text{ ksi}$; $s_{ac} = 65.0 \text{ ksi}$ – U.S.: $s_{at} = 163 \text{ MPa}$; $s_{ac} = 448 \text{ MPa}$ – SI [Table 9-6]
k. $s_{at} = 12.0 \text{ ksi}$; s_{ac} not listed: $s_{at} = 83.0 \text{ MPa}$; s_{ac} not listed [[Table 9-14]]
l. $s_{at} = 9.0 \text{ ksi}$; s_{ac} not listed: $s_{at} = 62.0 \text{ MPa}$; s_{ac} not listed [Table 9-14]

Pinion requires HB 341: SAE 4340 OQT 1000; HB 363

Gear requires HB 332: SAE 4340 OQT 1000; HB 363 (Same as pinion)

DESIGN OF SPUR GEARS		APPLICATION: NOTE: SI Metric data	
Initial Input Data:		Factors In Design Analysis:	
Input Power: $P = 75.0 \text{ kW}$	Input Speed: $n_P = 4500 \text{ rpm}$	Alignment Factor, $C_{\text{pt}} = 1.0 + C_{\text{pt}} + C_{\text{rea}}$	If $F < 25 \text{ N}$
[See Table 8-3] Module: $m = 4.00 \text{ mm}$	Number of Pinion Teeth: $N_P = 24$	Pinion Proportion Factor, $C_{\text{pt}} =$	0.040 [0.50 < $F/D_P < 2.00$]
Desired Output Speed: $n_G = 3600 \text{ rpm}$	Computed number of gear teeth: $N_G = 30.0$	Type of gearing: Open	Enter: $C_{\text{pt}} = 0.040$ Figure 9-16
Enter: Chosen No. of Gear Teeth: $N_G = 30$	Computed data:	Mesh Alignment Factor, $C_{\text{rea}} =$	Commer. Precision Ex. Prec.
Actual Output Speed: $n_G = 3600.0 \text{ rpm}$	Gear Ratio: $m_G = 1.25$	Overload Factor: $K_o =$	0.280 0.158 0.093 0.058
Pitch Diameter - Pinion: $D_P = 96.00 \text{ mm}$	Pitch Diameter - Gear: $D_G = 120.00 \text{ mm}$	Size Factor: $K_s =$	1.00 Table 9-7
Center Distance: $C = 108.00 \text{ mm}$	Pitch Line Speed: $V_l = 22.62 \text{ m/s}$	Pinion Rim Thickness Factor: $K_{\text{ap}} =$	1.00 Table 9-8: Use 1.00 if $P_d >= 5$
Transmitted Load: $W_l = 3316 \text{ N}$	Enter: Design Life: 100000 hours	Gear Rim Thickness Factor: $K_{\text{ag}} =$	1.00 Fig. 9-18: Use 1.00 if solid blank
Secondary Input Data:	Enter: Number of load cycles: $N_p = 2.7E+10$	Dynamic Factor: $K_v =$	1.00 Fig. 9-18: Use 1.00 if solid blank
Min Nom Max	Gear • Number of load cycles: $N_G = 2.2E+10$	Service Factor: $SF =$	1.00 [Computed: See Fig. 9-19]
Enter: Face Width: $F = 50.0 \text{ mm}$	Bending Stress Cycle Factor: $Y_{NP} =$	Reliability Factor: $K_R =$	For K_v :
Ratio: Face width/pinion diameter: $F/D_P = 0.52$	Bending Stress Cycle Factor: $Y_{NG} =$	Enter: Design Life: 100000 hours	1.00 Table 9-11 Use 1.00 for $R = .99$
Recommended range of ratio: $0.50 < F/D_P < 2.00$	Pitting Stress Cycle Factor: $Z_{NP} =$	Enter: Number of load cycles: $N_p = 2.7E+10$	Guidelines: Y_{NI}, Z_N
Enter: Elastic Coefficient: $C_P = 191$	Pitting Stress Cycle Factor: $Z_{NG} =$	10 ⁶ cycles $> 10^6$	$< 10^6$
Enter: Quality Number: $A_v = 7$	Stress Analysis: Bending	Through-Hardened	Grade 1 Steel
REF: $N_p, N_G = 24$	Pinion: Required $S_{st} = 98 \text{ MPa}$	HB 19	HB 19 Fig. 9-11
Enter: Bending Geometry Factors: Press. angle = 20 deg	Gear: Required $S_{st} = 93 \text{ MPa}$	HB 8	HB 8 Fig. 9-11
Pinion: $J_P = 0.347$	Stress Analysis: Pitting		
Gear: $J_G = 0.365$	Pinion: Required $S_{ac} = 889 \text{ MPa}$	HB 310	HB 310 Fig. 9-12
Enter: Pitting Geometry Factor: $I = 0.084$	Gear: Required $S_{ac} = 878 \text{ MPa}$	HB 305	HB 305 Fig. 9-12
REF: $m_G = 1.25$	Specify materials, alloy and heat treatment, for most severe requirement.		
	One possible material specification: Steel pinion, Steel gear		
	Pinion requires HB 310: SAE 4340 OQT 1100; HB 321		
	Gear requires HB 305: SAE 4340 OQT 1100; HB 321 (Same as pinion)		

APPLICATION: Problem 67	
Commercial band saw driven by an electric motor	
Initial Input Data:	
Overspeed Factor: $K_o = 1.50$	Table 9-7
Transmitted Power: $P = 12 \text{ hp}$	
Design Power $P_{des} = 18 \text{ hp}$	
Diametral Pitch: $P_d = 10$	Fig. 9-24
Input Speed: $n_p = 3450 \text{ rpm}$	
Number of Pinion Teeth: $N_p = 18$	
Desired Output Speed: $n_g = 730 \text{ rpm}$	
Computed number of gear teeth: 85.1	
Enter: Chosen No. of Gear Teeth: $N_g = 85$	
Computed data:	
Actual Output Speed: $n_g = 730.6 \text{ rpm}$	
Gear Ratio: $m_g = 4.72$	
Pitch Diameter - Pinion: $D_p = 1,800 \text{ in}$	
Pitch Diameter - Gear: $D_g = 8,500 \text{ in}$	
Center Distance: $C = 5,150 \text{ in}$	
Pitch Line Speed: $v_i = 1626 \text{ ft/min}$	
Transmitted Load: $W_t = 244 \text{ lb}$	
Secondary Input Data:	
Face Width Guidelines (in): 0.800 Min	1.200 Norm
1.250 Max	
Enter: Face Width: $F = 1.250 \text{ in}$	
Ratio: Face width/pinion diameter: $F/D_p = 0.69$	
Recommended range of ratio: $0.50 < F/D_p < 2.00$	
Enter: Elastic Coefficient: $C_p = 2300$	Table 9-10
Enter: Quality Number: $A_v = 9$	Table 9-3
Dynamic Factor: $K_v = 1.33$	Table 9-8
[Factors for computing K_v :] $\beta = 0.630$	$C = 70.71$
Reference: $N_p = 18$	$N_g = 85$
Bending Geometry Factor-Pinion: $J_p = 0.310$	Fig. 9-15
Bending Geometry Factor-Gear: $J_g = 0.400$	Fig. 9-15
Reference: $m_g = 4.72$	
Enter: Pitting Geometry Factor: $i = 1.06$	Fig. 9-21

DESIGN OF SPUR GEARS	
Factors In Design Analysis:	
Alignment Factor, $K_m = 1.0 + C_{pf} + C_{me}$	If $F > 1.0$
Pinion Proportion Factor, $C_{pf} = 0.044$	0.048 [If $F < 1.0$]
Enter: $C_{pf} = 0.048$	Figure 9-16
Type of gearing: Open Comm. Precision	Ex. Prec.
Mesh Alignment Factor, $C_{me} = 0.268$	0.147 0.063 0.051
Enter: $C_{me} = 0.147$	Figure 9-17
Alignment Factor: $K_m = 1.20$	[Computed]
Size Factor: $K_s = 1.00$	Table 9-8: Use 1.00 if $P_d \geq 5$
Pinion Rim Thickness Factor: $K_{sp} = 1.00$	Fig. 9-18: Use 1.00 if solid blank
Gear Rim Thickness Factor: $K_{sg} = 1.00$	Fig. 9-18: Use 1.00 if solid blank
Service Factor: $SF = 1.00$	Use 1.00 if no unusual conditions
Reliability Factor: $K_R = 1.00$	Table 9-11 Use 1.00 for $R \approx .99$
Enter: Design Life: 8000 hours	See Table 9-12
Pinion - Number of load cycles: $N_p = 1.7E+09$	Guidelines: Y_N, Z_N
Gear - Number of load cycles: $N_g = 3.5E+08$	10^8 cycles $> 10^9$
Bending Stress Cycle Factor: $Y_{NG} = 0.93$	Fig. 9-22
Bending Stress Cycle Factor: $Y_{NP} = 0.96$	Fig. 9-22
Pitting Stress Cycle Factor: $Z_{NP} = 0.89$	Fig. 9-23
Pitting Stress Cycle Factor: $Z_{NG} = 0.92$	Fig. 9-23
Stress Analysis: Bending	
Pinion: Required $s_{st} = 16,101 \text{ psi}$	See Fig. 9-11 or
Gear: Required $s_{st} = 12,088 \text{ psi}$	Table 9-5
Stress Analysis: Pitting	
Pinion: Required $s_{ac} = 127,487 \text{ psi}$	See Fig. 9-12 or
Gear: Required $s_{ac} = 123,310 \text{ psi}$	Table 9-5
Required hardness of pinion HB: 305	Equations in Fig. 9-12-Grade 1
Required hardness of gear HB: 293	Equations in Fig. 9-12-Grade 1
Specify materials, alloy and heat treatment, for most severe requirement.	
One possible material specification:	
Pinion requires HB 305: SAE 4140 OQT 1100; HB 321, 19% Elongation	
Gear requires HB 293: SAE 4140 OQT 1200; HB 293, 20% Elongation	
Comments:	
It would be reasonable to specify the same heat treatment for both the pinion and the gear because their contact stresses are very similar.	

APPLICATION: Problem 68		DESIGN OF SPUR GEARS	
Commercial band saw driven by an electric motor		Factors In Design Analysis:	
Initial Input Data:		Alignment Factor: $K_m = 1.0 + C_{pr} + C_{ma}$ If $F < 1.0$ Pinion Proportion Factor, $C_{pr} = 0.063$ 0.064 [0.50 < $F/D_p < 2.00$] Enter: $C_{pr} = 0.064$ Figure 9-16	
Overload Factor: $K_o = 1.50$ Table 9-7		Type of gearing: Open Comm. Precision Ex. Prec. Mesh Alignment Factor, $C_{ma} = 0.266$ 0.145 0.082 0.049 Enter: $C_{ma} = 0.145$ Figure 9-17	
Transmitted Power: $P = 12 \text{ hp}$		Alignment Factor: $K_m = 1.21$ [Computed]	
Design Power $P_{des} = 18 \text{ hp}$		Size Factor: $K_s = 1.00$ Table 9-8: Use 1.00 if $P_d >= 5$ Pinion Rim Thickness Factor: $K_{sp} = 1.00$ Fig. 9-16: Use 1.00 if solid blank

<i>Specify materials, alloy and heat treatment, for most severe requirement.</i>								
<i>One possible material specification:</i>								
Reference: $m_G = 2.33$	Enter: Pitting Geometry Factor: $I = 0.088$	Reference: $m_G = 2.33$	Enter: Pitting Geometry Factor: $I = 0.088$	Pinion requires HB 304; SAE 4340 OCT 1100; HB 321; 19% elongation	<i>Larger face width required for pair 2 (0.56 in) vs. 0.25 in for pair 1</i>			
Bending Geometry Factor-Pinion: $J_P = 0.250$	Bending Geometry Factor-Gear: $J_G = 0.355$			Gear requires HB 296; SAE 4340 OCT 1100; HB 321; 19% elongation	<i>Stresses nearly equal for pair 2 and for both pairs</i>			
				Comments:	<i>Equal diametral pitches (24) used for both pairs</i>			

DESIGN OF PLASTIC SPUR GEARS

Application:

Band saw driven by electric motor

Problem 77

Initial Input Data:

Input Power: $P = 0.25 \text{ HP}$

Input Speed: $n_I = 651 \text{ rpm}$

Diametral Pitch: $P_d = 12$

Number of Pinion Teeth: $N_p = 18$

Desired Output Speed: $n_O = 159.15 \text{ rpm}$

Computed number of gear teeth: 62.319

Enter Chosen (No. of Gear Teeth) $N_g = 62$

Computed data:

Actual Output Speed: $n_G = 160.0 \text{ rpm}$

Gear Ratio: $m_G = 3.444$

Pitch Diameter - Pinion: $D_p = 1.500 \text{ in}$

Pitch Diameter - Gear: $D_g = 5.167 \text{ in}$

Center Distance: $C = 6.667 \text{ in}$

Pitch Line Speed: $v_t = 216.4 \text{ ft/min}$

Transmitted Load: $W_t = 38.11 \text{ lb}$

Secondary Input Data - Pinion:

Tooth Form: 20 degree full depth

Lewis Form Factor: $Y = 0.524$

Table 9-15

Safety Factor: $SF = 1.50$

Ref. Table 9-17

Material: Unfilled Nylon

Allowable Bending Stress: $s_{st} = 5400 \text{ psi}$

Table 9-14 or Fig. 9-28

Required Face Width: $F = 0.219 \text{ in}$

Enter Specified Face Width: $F = 0.220 \text{ in}$

Actual Bending Stress in Pinion: $s_t = 5985 \text{ psi}$

Secondary Input Data - Gear:

Tooth Form: 20 degree full depth Same as for pinion

Lewis Form Factor: $Y = 0.716$

Table 9-15

Safety Factor: $SF = 1.50$

Same as for pinion

Material: Unfilled Acetal

Allowable Bending Stress: $s_{st} = 5900 \text{ psi}$

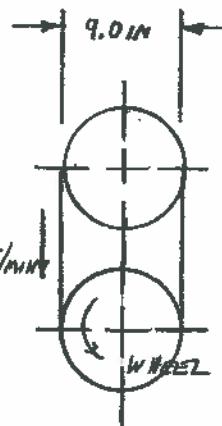

Table 9-14 or Fig. 9-28

Face Width - Gear: $F = 0.220 \text{ in}$

Same as for pinion

Actual Bending Stress in Gear: $s_t = 4355 \text{ psi}$

Must be $< s_{st}$

From Problem 76

$$N_{\text{WHEEL}} = N_{\text{BLADE}} = 375 \text{ ft/min}$$

To produce blade speed of 375 ft/min

$$N_{\text{WHEEL}} = \pi D_w m_w / 12$$

$$m_w = \frac{12 N_{\text{WHEEL}}}{\pi D_w} = \frac{12(375)}{\pi(9.0 \text{ IN})}$$

$$m_w = 159.2 \text{ RPM}$$

CONNECT WHEEL ON OUTPUT SHAFT OF GEAR REDUCER.
ONE PAIR OF GEARS.

7B.

RACK DRIVEN FURNACE DOOR. $N_{RACK} \geq 2.0 \text{ FT/S} = 120 \text{ FT/MIN}$

$$N_R = N_{G_D} = \pi D_D m_D / 12$$

$$m_D \geq \frac{12 N_{G_D}}{\pi D_D} = \frac{(2)(120)}{\pi D_D} = \frac{458.4}{D_D}$$

Possible Values for D_D :

D_D	m_D	$TV = m_A/m_D$
10.0 IN	45.84 RPM	32.72
9.0 IN	50.93	29.45
12.167	37.76	39.72 USED THIS

PAIR 1: $m_A = 1500 \text{ RPM}$ $m_B = 172.3 \text{ RPM}$

$$N_A = 17, N_B = 148, V_{R1} = 8.71$$

PAIR 2: $m_c = m_B = 172.3 \text{ RPM}$; $m_D = 37.76$

$$N_c = 16, N_D = 73, V_{R2} = 4.56$$

SEE TWO SPREADSHEET SOLUTIONS

DESIGNED FOR OPEN GEARING

DESIGN LIFE: IN EACH CYCLE, RACK MOVES 6FT EACH WAY

TOTAL OF 12FT FOR FULL CYCLE. AT 2.0 FT/S, CYCLE TIME IS:

$$\frac{1 \text{ SEC.}}{2.0 \text{ FT}} \times 12 \text{ FT} = 6.0 \text{ SEC./CYCLE}$$

$$\frac{6.0 \text{ SEC.}}{\text{CYCLE}} \times \frac{6 \text{ CYCLES}}{\text{hr}} \times \frac{24 \text{ hr}}{\text{DAY}} \times \frac{365 \text{ DAYS}}{\text{YR}} \times \frac{15 \text{ YRS}}{} \times \frac{\text{hr}}{3600 \text{ S}} = 1314 \text{ hr}$$

USE 1500 hr DESIGN LIFE.

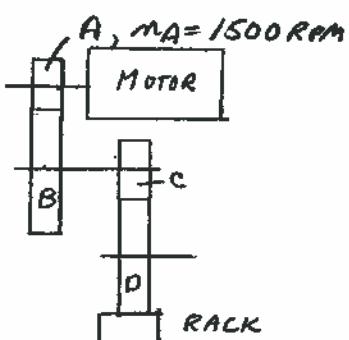

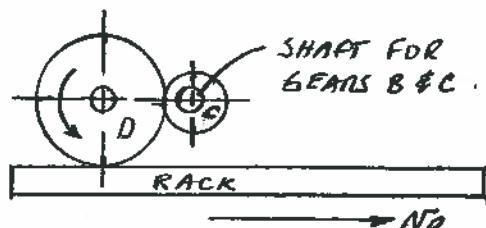

SUMMARY: POWER = 5.0 hp, $K_0 = 1.50$, $P_{des} = 7.5 \text{ hp}$, QUALITY = $A_V = 11$

PAIR 1: $\frac{P_d}{10} \frac{N_p}{17} \frac{N_g}{172} \frac{D_p}{1.700} \frac{D_g}{147.800} \frac{F}{12.00} \frac{C}{8.250}$ } WELL BALANCED IN SIZE.

PAIR 2: 6 16 73 2.667 12.167 2.500 7.417 }

ALL GEARS MADE FROM SAE 4340: PAIR 1 - OQT 1100; HB 321

PAIR 2 - OQT 900; HB 388

APPLICATION: Problem 78 - First pair		Factors in Design Analysis:	
Rack and pinion drive driven by a fluid power motor		Pinion Proportion Factor, $C_{pf} = 1.0 + C_{pf} + C_{ma}$

Same material used for both Pair 1 and Pair 2; Different tempering temperatures.

79.

GEAR DRIVE FOR A LIFT TRUCK

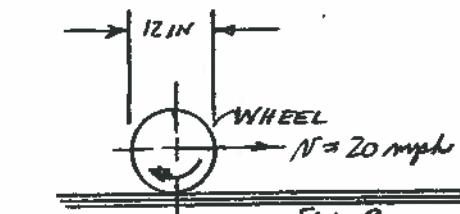

ROLLING WHEEL IS THE INVERSE OF A PINION DRIVING A RACK.

N AT CENTER OF WHEEL EQUALS SPEED OF LIFT TRUCK.

$$N = \pi D_w m_w / 12$$

$$m_w = \frac{12 N}{\pi D_w} = \frac{12 (1760 \text{ FT/MIN})}{\pi (12 \text{ IN})} = 560.23 \text{ RPM}$$

$$\text{TRAIN VALUE} = 3000 / 560.23 = 5.355$$

$$N = \frac{20 \text{ Mi}}{\text{hr}} \times \frac{5280 \text{ FT}}{\text{mi}} \times \frac{\text{min}}{60 \text{ MIN}}$$

$$N = 1760 \text{ FT/MIN.}$$

THIS TV COULD BE PRODUCED BY ONE PAIR OF GEARS.
HOWEVER, FOR POWER REQUIRED, GEAR WOULD BE TOO
LARGE TO ATTACH TO AXLE WITH 12-IN WHEEL.

USE DOUBLE REDUCTION. SEE TWO FOLLOWING PAGES.

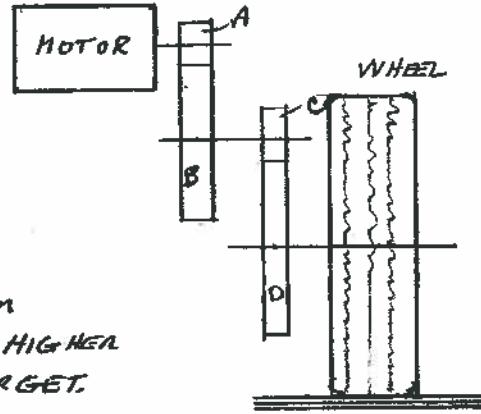

$$VR_1 = \frac{N_B}{N_A} = \frac{50}{17} = 2.94$$

$$VR_2 = \frac{N_D}{N_C} = \frac{38}{21} = 1.81$$

$$M_W = M_D = M_A \cdot \frac{N_A \ N_C}{N_B \ N_D}$$

$$M_W = 3000 \cdot \frac{17}{50} \cdot \frac{21}{38} = 563.7 \text{ RPM}$$

SLIGHTLY HIGHER
THAN TARGET.

NOTE GEARS HAVE $P_d = 6$ FOR PAIR 1
AND $P_d = 5$ FOR PAIR 2. FACE WIDTHS ARE
RELATIVELY LARGE. $F_1 = 2.50 \text{ IN}$, $F_2 = 3.00 \text{ IN}$.
REDISEIGN WITH HELICAL GEARS SHOULD ALLOW
A SMALLER SYSTEM.
ALSO ALL GEARS USE SAME MATERIAL AND
HEAT TREATMENT.

LIFE CALCULATION:

$$\frac{16 \text{ h}}{\text{DAY}} \times \frac{6 \text{ DAYS}}{\text{WK}} \times \frac{52 \text{ WKS}}{\text{YR}} \times 20 \text{ YR} = 99840 \text{ h} \quad \text{USE } L = 100000 \text{ h}$$

DESIGN DECISIONS: SF = 1.00, K_R = 1.50 [1 FAILURE IN 10000; $R = 0.9999$]

Reference: $m_g = 1.81$	Pinion requires HB 320; SAE 4340 OCT 1100; HB 321; 19% elongation
Enter: Pitting Geometry Factor: $f = 0.092$ Fig. 9-21	Gear requires HB 315; SAE 4340 OCT 1100; HB 388; 19% elongation
Comments:	
Same material and heat treatment used for pinion and gear.	
Same material used for both Part 1 and Part 2; Same tempering temperature.	

DESIGN OF PLASTIC SPUR GEARS

Application:

Small band saw driven by an electric motor

Problem 9D - One possible design

Initial Input Data:

Input Power: $P = 0.5 \text{ hp}$

Input Speed: $n_P = 360 \text{ rpm}$

Diametral Pitch: $P_d = 12$

Number of Pinion Teeth: $N_p = 18$

Desired Output Speed: $n_G = 266 \text{ rpm}$

Computed number of gear teeth: 58.195

Enter Chosen No. of Gear Teeth: $N_g = 58$

Computed data:

Actual Output Speed: $n_G = 266.9 \text{ rpm}$

Gear Ratio: $m_g = 3.222$

Pitch Diameter - Pinion: $D_p = 1.500 \text{ in}$

Pitch Diameter - Gear: $D_g = 4.833 \text{ in}$

Center Distance: $C = 6.333 \text{ in}$

Pitch Line Speed: $v_t = 337.7 \text{ ft/min}$

Transmitted Load: $W_t = 48.84 \text{ lb}$

Secondary Input Data - Pinion:

Tooth Form: 20 degree full depth

Lewis Form Factor: $Y = 0.521$

Table 9-15

Safety Factor: $SF = 1.50$

Ref. Table 9-7

Material: Nylon

Allowable Bending Stress: $s_{af} = 6000 \text{ psi}$ Table 9-14 or Fig. 9-28

Required Face Width: $F = 0.281 \text{ in}$

Enter Specified Face Width: $F = 0.300 \text{ in}$

Actual Bending Stress in Pinion: $s_t = 5624 \text{ psi}$

Secondary Input Data - Gear:

Tooth Form: 20 degree full depth Same as for pinion

Lewis Form Factor: $Y = 0.700$ Table 9-15

Safety Factor: $SF = 1.50$ Same as for pinion

Material: Acetal

Allowable Bending Stress: $s_{ag} = 5000 \text{ psi}$ Table 9-14 or Fig. 9-28

Face Width - Gear: $F = 0.300 \text{ in}$ Same as for pinion

Actual Bending Stress in Gear: $s_t = 4133 \text{ psi}$ Must be $< s_{ag}$

DESIGN OF PLASTIC SPUR GEARS

Application:

Paper feed roll driven by an electric motor

Problem 81 - One possible design

Initial Input Data:

Input Power: $P = 0.06 \text{ hp}$

Input Speed: $n_P = 88 \text{ rpm}$

Diametral Pitch: $P_d = 20$

Number of Pinion Teeth: $N_P = 16$

Desired Output Speed: $n_O = 21 \text{ rpm}$

Computed number of gear teeth: 67.048

Enter Chosen No. of Gear Teeth: $N_G = 67$

Computed data:

Actual Output Speed: $n_G = 21.0 \text{ rpm}$

Gear Ratio: $m_G = 4.188$

Pitch Diameter - Pinion: $D_P = 0.800 \text{ in}$

Pitch Diameter - Gear: $D_G = 3.350 \text{ in}$

Center Distance: $C = 4.150 \text{ in}$

Pitch Line Speed: $v_t = 18.4 \text{ ft/min}$

Transmitted Load: $W_t = 107.4 \text{ lb}$

Secondary Input Data - Pinion:

Tooth Form: *20 degree stub*

Lewis Form Factor: $\gamma = 0.578$

Safety Factor: $SF = 1.25$

Material: Nylon-glass filled

Allowable Bending Stress: $s_{af} = 12000 \text{ psi}$

Table 9-15

Ref. Table 9-7

Table 9-14 or Fig. 9-28

Required Face Width: $F = 0.387 \text{ in}$

Enter Specified Face Width: $F = 0.400 \text{ in}$

Actual Bending Stress in Pinion: $s_t = 11612 \text{ psi}$

Secondary Input Data - Gear:

Tooth Form: *20 degree stub* Same as for pinion

Lewis Form Factor: $\gamma = 0.782$ Table 9-15

Safety Factor: $SF = 1.25$ Same as for pinion

Material: Nylon-glass filled

Allowable Bending Stress: $s_{af} = 12000 \text{ psi}$ Table 9-14 or Fig. 9-28

Face Width - Gear: $F = 0.400 \text{ in}$ Same as for pinion

Actual Bending Stress in Gear: $s_t = 8583 \text{ psi}$ Must be $< s_{af}$

THE FOLLOWING PAGES GIVE SAMPLE DESIGNS FOR PROBLEMS 5-11. THE PROCEDURE IS SIMILAR TO THAT USED IN EXAMPLE PROBLEM 10-2. OTHER DESIGNS ARE POSSIBLE. READER IS ENCOURAGED TO WORK TOWARD A PARTICULAR GOAL OF MATERIAL TYPE, CENTER DISTANCE, OVERALL SIZE OR OTHER APPLICATION-SPECIAL GOAL.

NOTE THAT TRANVERSE DIAMETRAL PITCH MUST BE INPUT. IF NORMAL DIAMETRAL PITCH IS ORIGINALLY SPECIFIED, COMPUTE $P_d = P_{nd} \cos \psi$.

DESIGN OF HELICAL GEARS-U.S.

APPLICATION:

Reciprocating compressor driven by an electric motor
Problem 10-5**Initial Input Data:**

Input Power: $P = 5 \text{ hp}$

Input Speed: $n_P = 1200 \text{ rpm}$

Transverse Diametral Pitch, $P_d: P_d = 18$

Number of Pinion Teeth: $N_P = 18$

Desired Output Speed: $n_G = 387.5 \text{ rpm}$

Computed number of gear teeth: $N_G = 55.7$

Enter: Chosen No. of Gear Teeth: $N_G = 56$

Computed data:

Actual Output Speed: $n_G = 385.7 \text{ rpm}$
Gear Ratio: $m_G = 3.11$

Pitch Diameter - Pinion: $D_P = 1.000 \text{ in}$

Pitch Diameter - Gear: $D_G = 3.111 \text{ in}$

Center Distance: $C = 2.056 \text{ in}$

Pitch Line Speed: $v_I = 314 \text{ ft/min}$

Transmitted Load: $W_I = 526 \text{ lb}$

Secondary Input Data:

Transverse pressure angle: $\phi_I = 20.0 \text{ deg}$

Helix angle: $\psi = 25.0 \text{ deg}$

Axial Pitch: $P_x = 0.3743 \text{ in}$

Min. Face Width (2 x Axial Pitch): $F_{min} = 0.749 \text{ in}$

Enter: Face Width: $F = 1.200 \text{ in}$

Enter: Elastic Coefficient: $C_p = 2300 \text{ Table 9-10}$

Enter: Quality Number: $A_v = 11 \text{ Table 9-3}$

REF: $N_P, N_G = 18 \quad 56$

Enter: Bending Geometry Factors:

Pinion: $J_P = 0.453 \text{ Fig 10-5,6,7}$

Gear: $J_G = 0.486 \text{ Fig 10-5,6,7}$

Enter: Pitting Geometry Factor: $I = 0.205 \text{ Tab. 10-1,2}$

REF: $m_S = 3.11$

Axial Force: $W_x = 245 \text{ lb}$

Radial Force: $W_r = 191 \text{ lb}$

Stress Analysis: Bending

Pinion: Required $S_{st} = 42,786 \text{ psi}$

Gear: Required $S_{st} = 39,050 \text{ psi}$

See Fig. 9-11 or
Table 9-5See Fig. 9-12 or
Table 9-5

Specify materials, alloy and heat treatment, for most severe requirement.

One possible material specification: Steel pinion and gear: Carburized, Grade 1

Pinion requires HRC 58 min.: SAE 4320 SOQT 450; HRC 59; Carburized

Gear requires HRC 58 min.: SAE 4320 SOQT 450; HRC 59; Carburized

Factors in Design Analysis:

Alignment Factor, $K_m = 1.0 + C_{pf} + C_{ma}$

Pinion Proportion Factor, $C_{pf} = 0.095$

Enter: $C_{pf} = 0.098 \text{ Figure 9-16}$

Type of gearing: Open Comm. Precision Ex. Prec.

Mesh Alignment Factor, $C_{ma} = 0.267$

Enter: $C_{ma} = 0.146 \text{ 0.083 0.050}$

Alignment Factor: $K_m = 1.24 \text{ [Computed]}$

Overload Factor: $K_o = 1.50 \text{ Table 9-7}$

Size Factor: $K_s = 1.00 \text{ Table 9-8: Use 1.00 if } P_d >= 5$

Pinion Rim Thickness Factor: $K_{AP} = 1.00 \text{ Fig. 9-18: Use 1.00 if solid blank}$

Gear Rim Thickness Factor: $K_{AG} = 1.00 \text{ Fig. 9-18: Use 1.00 if solid blank}$

Dynamic Factor: $K_v = 1.24 \text{ [Computed: See Fig. 9-20]}$

Bending Stress Cycle Factor: $Y_{NP} = 0.94$

Bending Stress Cycle Factor: $Y_{NG} = 0.96$

Pitting Stress Cycle Factor: $Z_{NP} = 0.90$

Pitting Stress Cycle Factor: $Z_{NG} = 0.92$

Stress Analysis: Pitting

Pinion: Required $S_{st} = 179,572 \text{ psi}$

Gear: Required $S_{st} = 175,668 \text{ psi}$

See Fig. 9-11 or
Table 9-5

Specify materials, alloy and heat treatment, for most severe requirement.

One possible material specification: Steel pinion and gear: Carburized, Grade 1

Pinion requires HRC 58 min.: SAE 4320 SOQT 450; HRC 59; Carburized

Gear requires HRC 58 min.: SAE 4320 SOQT 450; HRC 59; Carburized

DESIGN OF HELICAL GEARS-U.S.

APPLICATION:

Milling machine driven by an electric motor
Problem 10-6**Initial Input Data:**

Input Power: $P = 20 \text{ hp}$
 Input Speed: $n_P = 550 \text{ rpm}$
 Transverse Diametral Pitch, $P_d: P_d = 10$
 Number of Pinion Teeth: $N_P = 24$
 Desired Output Speed: $n_G = 185 \text{ rpm}$

Computed number of gear teeth: $N_G = 71.4$
Enter: Chosen No. of Gear Teeth: $N_G = 72$
Computed data:

Actual Output Speed: $n_G = 183.3 \text{ rpm}$
 Gear Ratio: $m_G = 3.00$
 Pitch Diameter - Pinion: $D_P = 2.400 \text{ in}$
 Pitch Diameter - Gear: $D_G = 7.200 \text{ in}$
 Center Distance: $C = 4.800 \text{ in}$
 Pitch Line Speed: $V_t = 346 \text{ ft/min}$
 Transmitted Load: $W_t = 1910 \text{ lb}$

Secondary Input Data:

Transverse pressure angle: $\phi_t = 20.0 \text{ deg}$
 Helix angle: $\psi = 15.0 \text{ deg}$
 Axial Pitch: $P_x = 1.1725 \text{ in}$
 Min. Face Width (2 x Axial Pitch): $F_{min} = 2.345 \text{ in}$
Enter: Face Width: $F = 2.500 \text{ in}$
Enter: Elastic Coefficient: $C_p = 2300$ Table 9-10
Enter: Quality Number: $A_v = 9$ Table 9-3

Pinion: $J_p = 0.258 \text{ Fig. 10-15}$	Gear: $J_g = 0.220 \text{ Fig. 10-15}$	Stress Analysis - Pitting: Assumes $C_{xp} = 1.5$ for properly crowned teeth	
Enter: Pitting Geometry Factor: $I = 0.083 \text{ Fig. 10-19}$		Pinion: Required $s_{ac} = 91,011 \text{ psi}$	See Fig. 10-21 or
		Gear: Required $s_{ac} = 84,988 \text{ psi}$	Table 10-4
Specify materials, alloy and heat treatment, for most severe requirement.			
One possible material specification:			
Pinion: HB 266 required: SAE 6150 OQT 1200; HB = 293			
Gear: HB 316 required: SAE 6150 OQT 1100; HB = 341			

Problem 10-16

BEVEL GEARS

Forces and torque for shaft and bearing load analysis:

On Pinion Shaft - Torque: $T_P = 370.59$ lb-in

Mean radius of pinion: $r_m = 0.938$ in

Enter: pressure angle: $\phi = 20$ degrees

On Pinion - Tangential load: $W_{tP} = 395.2$ lb

On Pinion - Radial load: $W_{rP} = 135.6$ lb

On Pinion - Axial load: $W_{xP} = 47.9$ lb

On Gear Shaft - Torque: $T_G = 1050.0$ lb-in

On Gear - Tangential load: $W_{tG} = 395.2$ lb

On Gear - Radial load: $W_{rG} = 47.9$ lb

On Gear - Axial load: $W_{xG} = 135.6$ lb

See following page for stress analysis and design details.

DESIGN OF BEVEL GEARS

APPLICATION:		Conveyor with heavy shock driven by a gasoline engine Problem 10-16	
Initial Input Data:		Both gears straddle mounted	
Input Power: $P = 5 \text{ hp}$	Input Speed: $n_P = 850 \text{ rpm}$	Load distribution factor, K_m :	From Equation 10-16
		Select from:	
		Both gears straddle mounted:	Factor, K_{mb}
		One gear straddle mounted:	1.00
		Neither gear straddle mounted:	1.10
		Enter Factor, K_{mb}	1.25
		Enter Factor, K_{mb}	1.00
Computed data:		$K_m = 1.00$	
Actual Output Speed: $n_Q = 300.0 \text{ rpm}$		Overload Factor: $K_o = 2.00$	Table 9-7
Gear Ratio: $m_a = 2.83$		Bending Size Factor: $K_s = 0.51$	Figure 10-13 (for $P_d < 16$)
Pitch Diameter - Pinion: $D_P = 2.250 \text{ in}$		Dynamic Factor: $K_v = 1.241$	Computed: Table 9-9
Pitch Diameter - Gear: $D_G = 6.375 \text{ in}$		Pitting Size Factor: $C_s = 0.58$	For $0.50 < F < 3.14$
Pitch cone angle - Pinion: $\gamma = 19.44 \text{ degrees}$		For $F < 0.50, C_s = 0.5$	For $F > 3.14, C_s = 0.83$
Pitch cone angle - Gear: $\Gamma = 70.56 \text{ degrees}$		Enter C_s	Bending Reliability Factor: $K_R = 1.00$
Outer cone distance: $A_o = 3.3802 \text{ in}$		Service Factor: $SF = 1.00$	Use 1.00 if no unusual conditions
Pitch Line Speed: $V_l = 501 \text{ ft/min}$		Enter Design Life: 15000 hours	Pitting: $C_R = 1.00$
Transmitted Load: $W_t = 330 \text{ lb}$		Pinion - Number of load cycles: $N_P = 7.65E+08$	For $R = K_R$
Secondary Input Data:		Gear - Number of load cycles: $N_G = 2.70E+08$	$C_R = 0.9$
Face Width Guidelines (in): $1.014 \text{ in} \leq 1.250 \text{ in}$		Bending Stress Cycle Factor: $K_L = 0.94$	0.85
Enter Face Width: $F = 1.125 \text{ in}$		Bending Stress Cycle Factor: $K_L = 0.96$	0.99
Enter Elastic Coefficient: $C_p = 2300 \text{ Table 9-10}$		Pitting Stress Cycle Factor: $C_L = 1.02$	1.00
Enter Quality Number: $A_y = 10 \text{ Table 9-3}$		Pitting Stress Cycle Factor: $C_L = 1.08$	1.02
Enter: Bending Geometry Factors:		Stress Analysis - Bending:	
Pinion: $J_P = 0.240 \text{ Fig. 10-15}$		Pinion: Required $s_{av} = 13,300 \text{ psi}$	See Fig. 10-17 or
Gear: $J_G = 0.200 \text{ Fig. 10-15}$		Gear: Required $s_{av} = 15,628 \text{ psi}$	Table 10-4
Enter: Pitting Geometry Factor: $I = 0.081 \text{ Fig. 10-19}$		Stress Analysis - Pitting: Assumes $C_{xc} = 1.5$ for properly crowned teeth	
Pinion: Required $s_{av} = 133,166 \text{ psi}$		See Fig. 10-21 or	
Gear: Required $s_{av} = 125,768 \text{ psi}$		Table 10-4	
Through Hardened			
Grade 1 Steel			
HB 255 Fig. 10-17			
HB 307 Fig. 10-17

Specify materials, alloy and heat treatment, for most severe requirement.

One possible material specification:

*Pinion: HB 321 required: SAE 6150 OCT 1100; HB = 341
Gear: HB 307 required: SAE 6150 OCT 1100; HB = 341*

Problem 10-17

BEVEL GEARS

Forces and torque for shaft and bearing load analysis:

On Pinion Shaft - Torque: $T_P = 26.25$ lb-in

Mean radius of pinion: $r_m = 0.386$ in

Enter: pressure angle: $\phi = 20$ degrees

On Pinion - Tangential load: $W_{tP} = 68.0$ lb

On Pinion - Radial load: $W_{rP} = 23.9$ lb

On Pinion - Axial load: $W_{xP} = 6.3$ lb

On Gear Shaft - Torque: $T_G = 99.2$ lb-in

On Gear - Tangential load: $W_{tG} = 68.0$ lb

On Gear - Radial load: $W_{rG} = 6.3$ lb

On Gear - Axial load: $W_{xG} = 23.9$ lb

See following page for stress analysis and design details.

DESIGN OF BEVEL GEARS
APPLICATION: Reciprocating saw driven by an electric motor

Problem 10-17

Initial Input Data:		Factors in Design Analysis:	
		Both gears straddle mounted	
Input Power: $P = 0.75 \text{ hp}$	Load distribution factor, K_m :	From Equation 10-16	
Input Speed: $n_P = 1000 \text{ rpm}$	Select from:	Factor, K_{mb}	
Diametral Pitch: $P_d = 20$	Both gears straddle mounted:	1.00	
Number of Pinion Teeth: $N_P = 18$	One gear straddle mounted:	1.10	
Desired Output Speed: $n_G = 475 \text{ rpm}$	Neither gear straddle mounted:	1.25	
Computed number of gear teeth: $N_G = 68.2$	Enter Factor, K_{mb}	1.00	
Enter Chosen No. of Gear Teeth: $N_G = 68$	$K_m = 1.00$		
Computed data:			
Actual Output Speed: $n_G = 476.5 \text{ rpm}$	Overload Factor: $K_o = 1.75$	Table 9-7	For K_v
Gear Ratio: $m_a = 3.78$	Bending Size Factor: $K_s = 0.50$	Figure 10-13 (for $P_d < 16$)	$B = 0.826$
Pitch Diameter - Pinion: $D_p = 0.900 \text{ in}$	Dynamic Factor: $K_v = 1.277$	Computed: Table 9-9	$C = 59.7$
Pitch Diameter - Gear: $D_G = 3.400 \text{ in}$	Pitting Size Factor: $C_s = 0.50$	For $0.50 < F < 3.14$	
Pitch cone angle - Pinion: $\gamma = 14.83 \text{ degrees}$	For $F < 0.50$, $C_s = 0.5$	For $F > 3.14$, $C_s = 0.83$	
Pitch cone angle - Gear: $\Gamma = 75.17 \text{ degrees}$	Enter $C_s = 0.5$		
Outer cone distance: $A_o = 1.75586 \text{ in}$	Service Factor: $SF = 1.00$	Use 1.00 if no unusual conditions	
Pitch Line Speed: $V_l = 424 \text{ ft/min}$	Bending Reliability Factor: $K_R = 1.00$	Pitting: $C_R = 1.00$	For $R = K_R C_R$
Transmitted Load: $W_t = 58 \text{ lb}$	Enter: Design Life: 15000 hours	See Table 9-7	0.9 0.85 0.62
Secondary Input Data:			
Face Width Guidelines (in): $0.528 \text{ to } 0.586 \text{ in}$	Pinion - Number of load cycles: $N_p = 1.62E+09$	$Y_{N_p} Z_{N_p}$, Philon-Fig. 10-18; Gear-Fig. 10-20	0.99 1.00 1.00
Enter: Face Width: $F = 0.500 \text{ in}$	Gear - Number of load cycles: $N_g = 4.29E+08$	$N < 10^3$ $10^3 < N < 10^7$ $N > 10^7$	0.999 1.25 1.12
Enter: Elastic Coefficient: $C_p = 2300$	Bending Stress Cycle Factor: $K_L = 0.93$		
Enter: Quality Number: $A_v = 11$	Bending Stress Cycle Factor: $K_L = 0.95$	2.70 0.49 0.93	0.9999 1.50 1.22
Stress Analysis - Bending:			
Enter: Bending Geometry Factors:	Pinion: Required $s_{st} = 11,171 \text{ psi}$	See Fig. 10-17 or	HB 206 Fig. 10-17
Pinion: $J_p = 0.250$	Gear: Required $s_{st} = 13,018 \text{ psi}$	Table 10-4	HB 248 Fig. 10-17
Gear: $J_g = 0.210$			
Enter: Pitting Geometry Factor: $I = 0.085$	Stress Analysis - Pitting: Assumes $C_{ac} = 1.5$ for properly crowned teeth		
	Pinion: Required $s_{ac} = 119,964 \text{ psi}$	See Fig. 10-21 or	HB 283 Fig. 10-21
	Gear: Required $s_{ac} = 110,824 \text{ psi}$	Table 10-4	HB 256 Fig. 10-21
	Specify materials, alloy and heat treatment, for most severe requirement.		
	One possible material specification: Pinion: HB 283 required: SAE 6150 OQT 1200; HB = 293 Gear: HB 256 required: SAE 6150 OQT 1200; HB = 293		

WORMGEARING DATA FROM PROB. 8-52: $T_o = 924 \text{ LB-IN.}, n_G = 30 \text{ RPM}$

$$\underline{\text{FORCES: } W_{tG} = W_{xw} = T_o / (D_G/2) = 924 \text{ LB-IN.} / 2.001 \text{ in.} = 462 \text{ LB}}$$

$$\underline{\text{PITCH LINE SPEED OF GEAR: } N_{tG} = \pi D_G n_G / 12 = \pi (4.00)(30) / 12 = 31.4 \text{ FT/MIN.}}$$

$$\underline{\text{SLIDING VELOCITY: } N_s = N_{tG} / \sin(\alpha) = 31.4 / \sin(4.57) = 394 \text{ FT/MIN.}}$$

From FIG. 10-25; $\mu = 0.0323$ [computed from Eq. 10-27]

$$\underline{W_{xG} = W_{ew} = 462 \times \frac{\cos(4.5) \sin(4.57) + 0.0323 \cos(4.57)}{\cos(4.5) \cos(4.57) - 0.0323 \sin(4.57)} = 53 \text{ LB}}$$

$$\underline{W_{nG} = W_{nw} = \frac{462 \cdot \sin(4.5)}{\cos(4.5) \cos(4.57) - 0.0323 \cdot \sin(4.57)} = 120 \text{ LB}}$$

$$\underline{\text{FRICTION FORCE: } W_f = \frac{(0.0323)(462)}{\cos(4.57) \cos(4.5) - 0.0323 \sin(4.57)} = 15.5 \text{ LB}}$$

$$\underline{\text{FRICTION POWER LOSS: } P_L = \frac{N_s W_f}{33000} = \frac{(394)(15.5)}{33000} = 0.185 \text{ HP}}$$

$$\underline{\text{INPUT POWER: } P_{in} = P_o + P_L = \frac{T_o n_G}{63000} + 0.185 = 0.44 + 0.185 = 0.625 \text{ HP}}$$

$$\underline{\text{EFFICIENCY: } \eta = \frac{P_o}{P_{in}} \times 100\% = 70.4\% : \text{ INPUT SPEED: } n_G \cdot VR = (30)(40) = 1200 \text{ RPM}}$$

$$\underline{\text{STRESS: } \sigma_G = \frac{W_d}{M_F P_m} = \frac{W_{tG} \cdot G}{K_1 M_F \pi C_0 D_G^2} = \frac{462)(10)}{(0.974)(0.100)(0.625)(\pi)(\cos 4.57)} = 24235 \text{ PSI}}$$

$$K_r = 1200 / (1200 + N_{tG}) = 1200 / (1200 + 31.4) = 0.974$$

$$\underline{\text{PITTING: } W_{tr} = C_s D_G^{0.8} F_e C_m C_v = (1000)(4.00)^{0.8}(0.625)(0.814)(0.427) = 659 \text{ LB}}$$

BECAUSE $W_{tr} > W_{tG}$ - OK FOR PITTING.

$\sigma_G = 24235 \text{ PSI}$; SLIGHTLY HIGHER THAN $S_{UTS} = 24000 \text{ PSI}$ FOR PHosphor Bronze

(SEE SPREADSHEET SOLUTION ON FOLLOWING PAGE.)

Wormgear - Design		Problem: 10-18		
Input Data:				
Desired output torque:	$T_o = 924 \text{ lb-in}$			
Output speed:	$n_G = 30 \text{ rpm}$			
Velocity Ratio:	$VR = 40$			
Design Decisions:				
Diametral pitch:	$P_d = 10$			
No. of worm threads:	$N_w = 1$			
Required No. of gear teeth:	$N_g = 40$			
Specify No. of gear teeth:	$N_g = 40$			
Normal pressure angle:	$\phi_n = 14.5 \text{ degrees}$			
Computed Results and Additional Inputs:				
Actual input speed:	$n_w = 1200 \text{ rpm}$			
Actual velocity ratio:	$VR = 40$			
Gear pitch diameter:	$D_g = 4 \text{ in}$			
Specify worm diameter:	$D_w = 1.25 \text{ in}$			
Actual center distance:	$C = 2.625 \text{ in}$			
	$C_{0.975} / D_w = 1.96$			
	Should be >1.6 and <3.0			
Circular pitch of gear:	$p_g = 0.314 \text{ in}$			
Axial pitch of worm:	$p_{xw} = 0.314 \text{ in}$			
Lead of the worm:	$L = 0.314 \text{ in}$			
Lead angle:	$\lambda = 4.574 \text{ deg}$			
Addendum:	$a = 0.100 \text{ in}$			
Dedendum:	$b = 0.116 \text{ in}$			
Worm outside diameter:	$D_{ow} = 1.450 \text{ in}$			
Worm root diameter:	$D_{rw} = 1.019 \text{ in}$			
Nominal worm face length:	$F_{whm} = 1.789 \text{ in}$			
Gear throat diameter:	$D_{tg} = 4.200 \text{ in}$			
Nominal gear face width:	$F_{eg} = 0.735 \text{ in}$			
Max effective gear face width:	$0.67 \cdot D_w = 0.8375 \text{ in}$			
Effective gear face width:	$F_e = 0.625 \text{ in}$			
(Used given face width)				

Additional Computed Results:			
Pitch line speed - Gear:	31.42 ft/min	Sliding velocity $v_s = 394 \text{ ft/min}$	
Coefficient of friction:	$0.032 \text{ if } v_s > 10 \text{ ft/min}$		
Forces: (lb)		Gear Worm	
Tangential:	462	53	
Radial:	120	120	
Axial:	53	462	
Friction force, $W_f = 15.6 \text{ lb}$			
Power:			
Power output from gear:	0.440 hp		
Power loss - friction:	0.186 hp		
Power Input:	0.626 hp		
Efficiency:	70.3 %	Normal pressure angle, ϕ_n	
Stresses:		14.5 20 25 30	Lewis form factor, y
Bending Stress on Gear:			0.100 0.125 0.150 0.175
Enter: Lewis form factor: $y =$			Normal circular pitch: 0.313 in
Dynamic factor: $K_v =$	0.974		
Bending stress on gear:	24223 psi [Using effective gear face width]		
Allowable stresses-Bronze: Manganese = 17000 psi; Phosphor = 24000 psi]			
Surface Durability: [Hardened steel/worm; bronze gear]			
Type of bronze/D_g	$\rightarrow 2.5 \text{ in}$	$\leftarrow 2.5 \text{ in}$	
Sand cast: $C_s = 903$	1000	8 in	$\leftarrow 8 \text{ in}$
Chill cast or forged: $C_s =$		1137	$\rightarrow 25 \text{ in}$
Centrifugally cast: $C_s =$		1000	$\leftarrow 25 \text{ in}$
Enter: Materials factor: $C_s =$	1000	1137	1000
Gear Ratio: $m_g =$	6 to 20	20 to 76	$\rightarrow 76$ Actual $m_g = 40$
Ratio correction factor: $C_m =$	#NUM!	0.814	0.865
Enter: $C_m =$	0.814		
Sliding velocity:	<700	700-3000	>3000 Actual $v_s = 394$
Velocity factor: $C_v =$	0.427	0.439	0.642
Enter: $C_v =$	0.427		
Rated tangential load: $W_{IR} = 659 \text{ lb}$			
Must be $> W_t = 462 \text{ lb}$			

- Notes: 1. Bending stress on gear slightly high
 2. Suggest using larger face width; Say $F = F_e = 0.75 \text{ in}$.
 3. Equation for C_m produces invalid result for large gear ratio as $VR = 40$

Wormgearing - Design		Problem: 10-18A Adjusted $F_e = 0.750 \text{ in}$		Additional Computed Results:	
Input Data:

Effective gear face width: $F_e = 0.750 \text{ in}$	(Used given face width)	Enter: $C_v = 0.427$			
		Rated tangential load: $W_{tr} = 790 \text{ lb}$			
		Must be $> W_t = 462 \text{ lb}$			
Notes: 1. Bending stresses on gear OK for Phosphor Bronze					
2. Using $F = F_e = 0.75 \text{ in}$.					
3. Equation for C_m produces invalid result for large gear ratio as $VR = 40$					

Problems 10-19 and 10-20

COMPARISON OF THREE PROPOSED DESIGNS

See details on following three spreadsheets

Given data:

Diametral pitch, $P_d = 12$

Velocity ratio, $VR = 20$

Output speed (Gear) = 90 rpm

Worm pitch diameter, $D_w = 1.000$ in

See comment

Gear face width, $F = 0.500$ in

See comment

Normal pressure angle, $\phi_n = 14.5^\circ$ degrees

Assumed gear is made from chilled cast phosphor bronze**Allowable bending stress = 24,000 psi****Results:****DESIGN**

Number of threads in worm	A	B	C
Output torque (lb-in), $T_o =$	202	484	878
Output power (hp), $P_o =$	0.289	0.691	1.254
Gear bending stress (psi)	19190	23963	23987 Limits in Bold
Allowable bending stress (psi)	24000	24000	24000
Rated load for surface durability (lb)	242	418	714 Limits in Bold
Gear transmitted load (lb)	242	290	263
Efficiency (%) [Problem 20]	72.9	84.1	90.8
Power input (hp)	0.396	0.822	1.381
Lead angle (degrees)	4.76	9.46	18.4
Gear pitch diameter (in)	1.867	3.333	6.667
Center distance (in)	1.333	2.167	3.833

Comments on results:The given face width is small. Could use $F > 0.601$ in to maximize effective face width.

Worm diameter is too large for Design A. See Equations 10-46 and 10-47

Worm diameter is too small for Design C. See Equations 10-46 and 10-47

Design A is limited by surface durability

Designs B and C are limited by bending stress in gear teeth.

As number of threads in worm increases:

Lead angle increases

Efficiency increases

Torque and power capacity increase

BUT: Gear size and center distance increase

Wormgear - Design		Basis: 1000 ft/min gear face width	
Input Data:		Computed Results:	
Desired output torque: $T_o = 202 \text{ lb-in}$		Pitch line speed - Gear: 39.27 ft/min	
Output speed: $n_o = 90 \text{ rpm}$		Sliding velocity $v_s = 473 \text{ ft/min}$	
Vehicle Ratio: $VR = 20$		Coefficient of friction: $0.030 \text{ if } v_s > 10 \text{ ft/min}$	
Design Decisions:		Forces: (lb)	Gear Worm
Diagonal pitch: $\beta_d = 12$		Tangential: 242 28	
No. of worm gears: $N_w = 1$		Radial: 63 63	
Required No. of gear teeth: $N_G = 20$		Axial: 28 242	
Specify dia of gear teeth: $N_t = 20$		Fiction force, $W_f = 7.5 \text{ lb}$	
Normal pressure angle: $\phi_n = 14.5 \text{ degrees}$		Power:	
		Power output from gear: 0.289 hp	
		Power loss - friction: 0.107 hp	
		Power input: 0.396 hp	
Computed Results and Additional Inputs:		Efficiency: 72.9 %	Normal pressure angle, ϕ_n
Actual input speed: $n_W = 1800 \text{ rpm}$			14.5 20 25 30
Actual velocity ratio: $VR = 20$		Stresses:	
Gear pitch diameter: $D_G = 1.66967 \text{ in}$		Bending Stress on Gear:	
Specify worm diameter: $D_W = 1.960 \text{ in}$		Enter Lewis form factor, $y = 0.100$	Lewis form factor, y
Actual center distance: $C = 1.333 \text{ in}$			0.100 0.125 0.150 0.175
<i>Use smaller worm diameter</i> Should be $> 1.6 \text{ and } < 3.0$		Normal circular pitch: 0.261 in	
Circular pitch of gear: $p_G = 0.262 \text{ in}$		Dynamic factor: $K_v = 0.968$	
Axial pitch of worm: $p_{WY} = 0.262 \text{ in}$		Bending stress on gear: 19190 psi [Using effective gear face width]	
Lead of the worm: $L = 0.262 \text{ in}$		Allowable stresses-Bronze: $Manganese = 17000 \text{ psi}$; Phosphor = 24000 psi	
Lead angle: $\lambda = 4.764 \text{ deg}$		Surface Durability: [Hardened steel / worm; bronze gear]	
Addendum: $a = 0.083 \text{ in}$		Type of bronze/ D_G \rightarrow $> 2.5 \text{ in}$ $> 8 \text{ in}$ $< 6 \text{ in}$ $> 25 \text{ in}$ $< 25 \text{ in}$	
Dedendum: $b = 0.096 \text{ in}$		Sand cast: $C_s = 1084$ 1000	
Worm outside diameter: $D_{oW} = 1.167 \text{ in}$		Centrifugally cast: $C_s = 1311$ 1000	
Worm root diameter: $D_{RW} = 0.807 \text{ in}$		Cast, Manganese factor: $C_s = 1000$ 1211 1000	
Nominal worm face length: $F_{wom} = 1.054 \text{ in}$		Gear Ratio: $m_a = 6 \text{ to } 20$ 20 to 76 > 76 Actual $m_a = 20$	
Gear throat diameter: $D_{Gt} = 1.833 \text{ in}$		Ratio correction factor: $C_m = 0.820$ 0.819 0.017	
Nominal gear face width: $F_{es} = 0.601 \text{ in}$		Enter: $C_v = 0.819$	
Max effective gear face width: $0.677 D_W = 0.670 \text{ in}$		Sliding velocity: < 700 700-3000 > 3000 Actual $v_s = 473$	
Effective gear face width: $F_e = 0.500 \text{ in}$		Velocity factor: $C_v = 0.392$ 0.395 0.557	
		Enter: $C_s = 0.802$	
		Rated tangential load: $W_{tr} = 242 \text{ lb}$	
		Must be $> W_i = 242 \text{ lb}$	
Given face width is small; Could use $F > 0.601$		<i>Adjusted output torque until limits reached on either bending or surface durability</i>	
		<i>Surface durability controls this design</i>	

Wormgearing - Design	
Input Data:	
Desired output torque: $T_o = 484 \text{ lb-in}$	
Output speed: $n_o = 90 \text{ rpm}$	
Velocity ratio: $V_r = 20$	
Design Decisions:	
Desired pitch: $P_d = 12$	
No. of worm threads: $N_W = 2$	
Required No. of gear teeth: $N_g = 40$	
Specify No. of gear teeth: $N_g = 40$	
Normal pressure angle: $\phi_n = 14.5 \text{ degrees}$	
Computed Results and Additional Inputs:	
Actual input speed: $n_w = 1800 \text{ rpm}$	
Actual velocity ratio: $V_r = 20$	
Gear pitch diameter: $D_g = 3.33333 \text{ in}$	
Specify worm diameter: $D_w = 1.980 \text{ in}$

Gear Ratio: $m_G = 6$ to 20	20 to 76	>76	Actual $m_G = 40$
Ratio correction factor: $C_m = \#NUM!$	0.614	0.885	
Eff. Form factor, $f =$	0.70	0.70	0.70
Sliding velocity:	<700	700-3000	>3000
Velocity factor: $C_v =$	0.204	0.248	0.297
Eff. C_v =	0.204	0.248	0.297
Rated tangential load: $W_{tr} =$			
			990 lb
			840 lb
Must be > W_t =			

PROBLEM 10-24**COMPARISON OF DESIGNS A and B.**

Note: Also includes a revised Design A with
a smaller worm diameter and larger gear face width

Given data:	Design		
	A	B	A Revised
Diametral pitch:	6	10	6
Threads in worm:	1	2	1
Teeth in gear:	30	60	30
Worm diameter (in):	2.000	1.250	1.750 Design A Rev. - Smaller diameter
Face width - Gear (in):	1.000	0.625	1.130 Design A Rev. - Larger face width
Pressure angle (deg):	14.5	14.5	14.5
Results:			
Forces - Gear (lb):			
Tangential:	480	400	480
Radial:	125	106	125
Axial:	58	82	65
Forces - Worm (lb):			
Tangential:	58	82	65
Radial:	125	106	125
Axial:	480	400	480
Lead angle (degrees):	4.76	9.09	5.44 Design B - Higher lead angle
Efficiency (%):	69.1	77.6	70.6 Design B - Higher efficiency
Power output (hp):	0.381	0.381	0.381
Power input (hp):	0.552	0.491	0.54 Design B OK for 0.50 hp motor
Gear pitch diameter (in):	5.000	6.000	5.000 Design A smaller
Center distance (in):	3.500	3.625	3.375 Design A smaller
Stress - Wormgear (psi):	9400	21171	8324 Design A - Lower bending stress
Rated load - Durability (lb):	1193	937	1406
Design A - OK for sand cast Manganese Bronze			
Design B - OK for sand cast Phosphor bronze			

Worm gear - Design		Additional Computed Results:	
Input Data:		Pitch line speed - Gear: 26.18 ft/min Sliding velocity v_s = 315 ft/min Coefficient of friction: 0.036 if $v_s > 10$ ft/min	
Desired output torque: $T_o = 1200 \text{ lb-in}$		Forces: (lb)	
Output speed: $n_o = 20 \text{ rpm}$		Tangential: 480 58	Gear Worm
Velocity Ratio: $VR = 30$		Radial: 125 125	
Design Decisions:		Axial: 58 480	
Desired pitch: $P_d = 4$		Friction force, $W_f = 17.8 \text{ lb}$	
No. of worm throats: $N_w = 1$		Power:	
Required No. of gear teeth: $N_g = 30$		Power output from gear: 0.381 hp	
Speed: No. of gear teeth: $N_g = 30$		Power loss - friction: 0.171 hp	
Normal pressure angle: $\alpha_n = 14.5 \text{ degrees}$		Power Input: 0.552 hp	
Computed Results and Additional Inputs:		Efficiency: 69.1 %	
Actual Input speed: $n_w = 600 \text{ rpm}$		Normal pressure angle, ϕ_n : 14.5 20 25 30	
Actual velocity ratio: $VR = 30$		Lewis form factor, y : 0.100	
Gear pitch diameter: $D_g = 5 \text{ in}$		Enter Lewis form factor $y = 0.100$	Normal circular pitch: 0.522 in
Specify worm diameter: $D_w = 2.000 \text{ in}$		Bending Stress on Gear:	
Actual center distance: $C = 3.500 \text{ in}$		Enter Lewis form factor $y = 0.100$	Dynamic factor, $K_v = 0.979$
$C^{3/23}/D_w = 1.50$ LOW		Bending stress on gear: 9400 psi [Using effective gear face width]	
Use smaller worm diameter Should be > 1.6 and < 3.0		Allowable stresses-Bronze: Manganese = 17000 psi; Phosphor = 24000 psi	
Circular pitch of gear: $p_g = 0.524 \text{ in}$		Surface Durability: If Hardened steel worm; bronze gear	
Axial pitch of worm: $p_{xw} = 0.524 \text{ in}$		Type of bronze/ D_e → $> 2.5 \text{ in}$ Sand cast: $C_s = 857$ 1000	$< 2.5 \text{ in}$ Chill cast or forged: $C_s = 1083$ 1000
Lead of the worm: $L = 0.524 \text{ in}$		$< 8 \text{ in}$ Centrifugally cast: $C_s = 1126$ 1000	$> 8 \text{ in}$ $< 25 \text{ in}$
Lead angle: $\lambda = 4.764 \text{ deg}$		Sand cast: $C_s = 857$ 1000	
Addendum: $a = 0.167 \text{ in}$		Chill cast or forged: $C_s = 1083$ 1000	
Dedendum: $b = 0.193 \text{ in}$		Centrifugally cast: $C_s = 1126$ 1000	
Worm outside diameter: $D_{ow} = 2.333 \text{ in}$		Enter Materials factor: $C_f = 857$ Sand cast	
Worm root diameter: $D_{rw} = 1.614 \text{ in}$		Gear Ratio: $m_g = 6 \text{ to } 20$ 20 to 76 > 76 Actual $m_g = 30$	
Nominal worm face length: $F_{wam} = 2.582 \text{ in}$		Ratio correction factor: $C_m = 0.759$ 0.824 0.951	
Gear throat diameter: $D_t = 5.333 \text{ in}$		Enter $C_m = 0.524$	
Nominal gear face width: $F_{eg} = 1.202 \text{ in}$		Sliding velocity: < 700 700-3000 > 3000 Actual $v_s = 315$	
Max effective gear face width: $0.677 D_w = 1.340 \text{ in}$		Velocity factor: $C_v = 0.466$ 0.498 0.763	
Effective gear face width: $F_o = 1.000 \text{ in}$		Enter $C_v = 0.466$	
Given face width is small; Could use $F > 1.202$		Rated tangential load: $W_{tr} = 1193 \text{ lb}$ OK For sand cast bronze	
Must be $> W_t = 480 \text{ lb}$		Can use Manganese bronze based on bending stress in gear.	
Worm diameter is too large.			

Wormgear Design		
Input Data:		
Gear teeth type: Output speed, VR = 200 rpm	$n_w = 20$	in/min
Output speed, VR = 200 rpm	$n_g = 20$	in/min
Design Decisions:		
Desired ratio: $P_d = 10$		
No. of worm gears: $N_w = 2$		
Required No. of gear teeth: $N_g = 60$		
Spur gear teeth: $N_g = 60$		
Nominal pressure angle: $\alpha = 17.5^\circ$ degrees		
Computed Results and Additional Inputs:		
Actual input speed: $n_w = 600$ rpm		
Actual velocity ratio: $VR = 30$		
Gear pitch diameter: $D_g = 6$ in		
Spur gear diameter: $D_g = 250$ in		
Actual center distance: $C = 3.625$ in		
$C_{0.975}/D_w = 2.47$	OK	
Should be >1.6 and <3.0		
Circular pitch of gear: $p_g = 0.314$ in		
Axial pitch of worm: $p_{xw} = 0.314$ in		
Lead of the worm: $L = 0.628$ in		
Lead angle: $\lambda = 9.090$ deg		
Addendum: $a = 0.100$ in		
Dedendum: $b = 0.116$ in		
Worm outside diameter: $D_{aw} = 1.450$ in		
Worm root diameter: $D_{rw} = 1.019$ in		
Nominal worm face length: $F_{whom} = 2.191$ in		
Gear throat diameter: $D_{tg} = 6.200$ in		
Nominal gear face width: $F_{gg} = 0.735$ in		
Max effective gear face width: $0.677D_w = 0.838$ in		
Effective gear face width: $F_e = 0.625$ in		
[Used given face width]		
Given face width is small; Could use $F > 0.735$		
212		

Additional Computed Results:		
Pitch line speed - Gear: 31.42 ft/min		
Sliding velocity $v_s = 199$ ft/min		
Coefficient of friction: 0.043 if $v_s > 10$ ft/min		
Forces: (lb)	Gear Worm	
Tangential: 400	82	
Radial: 106	106	
Axial: 82	400	
Friction force, $W_f = 18.3$ lb		
Power:		
Power output from gear: 0.381 hp		
Power loss - friction: 0.110 hp		
Power Input: 0.491 hp		
Efficiency: 77.6 %		Normal pressure angle, ϕ_n
Stresses:		$14.5 \quad 20 \quad 25 \quad 30$
Bending Stress on Gear:		Lewis form factor, y
Effect Contact Factor: $C_e = 0.105$		$0.100 \quad 0.125 \quad 0.150 \quad 0.175$
Normal circular pitch: 0.310 in		
Dynamic factor: $K_v = 0.974$		
Bending stress on gear: 21171 psi [Using effective gear face width]		
Allowable stresses-Bronze: Manganese = 17000 psi; Phosphor = 24000 psi		
Surface Durability: If Hardened steel worm; bronze gear]		
Type of bronze/ D_g \rightarrow	>2.5 in	<2.5 in >8 in <8 in <25 in
Sand cast: $C_s = 819$	1000	
Chill cast or forged: $C_s = 1057$	1000	
Centrifugally cast: $C_s = 1111$	1000	
Enter Material: C = 819		Sand cast
Gear Ratio: $m_g = 6$ to 20	20 to 76	>76 Actual $m_g = 30$
Ratio correction factor: $C_m = 0.759$	0.824	0.951
Enter: $C_m = 0.759$		
Sliding velocity: <700 700-3000 >3000		Actual $v_s = 199$
Velocity factor: $C_v = 0.530$	0.648	1.090
Enter: $C_v = 0.530$		
Rated tangential load: $W_{fr} = 937$ lb		OK For sand cast bronze
Must be $> W_t = 400$ lb		
Can use Phosphor bronze based on bending stress in gear.		

Wormgearing - Design	
Input Data:	
Output gear torque: $T_{out} = 1000 \text{ lb-in}$	
Gear system efficiency ratio: $\eta_{gear} = 0.92$	
Worm gear ratio: $i_{wg} = 30$	
Design Decisions:	
Worm gear face width: $b_w = 1.75 \text{ in}$	
No. of gear teeth: $N_g = 30$	
Speed / life of gear teeth: $N_g = 30$	
Normal pressure angle: $\phi_n = 17.5^\circ \text{ degrees}$	
Computed Results and Additional Inputs:	
Actual input speed: $n_w = 600 \text{ rpm}$	
Actual velocity ratio: $VR = 30$	
Gear pitch diameter: $D_g = 5 \text{ in}$	
Speedy worm diameter: $D_w = 750 \text{ in}$	
Actual center distance: $C = 3.375 \text{ in}$	
$C_{0.975}/D_w = 1.66$	OK
Should be >1.6 and <3.0	
Circular pitch of gear: $p_g = 0.524 \text{ in}$	
Axial pitch of worm: $p_{aw} = 0.524 \text{ in}$	
Lead of the worm: $L = 0.524 \text{ in}$	
Lead angle: $\lambda = 5.440 \text{ deg}$	
Addendum: $a = 0.167 \text{ in}$	
Dedendum: $b = 0.193 \text{ in}$	
Worm outside diameter: $D_{ow} = 2.083 \text{ in}$	
Worm root diameter: $D_{rw} = 1.364 \text{ in}$	
Nominal worm face length: $F_{wnom} = 2.582 \text{ in}$	
Gear throat diameter: $D_{tg} = 5.333 \text{ in}$	
Nominal gear face width: $F_{eg} = 1.130 \text{ in}$	
Max effective gear face width: $0.87^* D_w = 1.173 \text{ in}$	
Effective gear face width: $F_e = 1.130 \text{ in}$	
<i>[Used nominal face width]</i>	

Additional Computed Results:	
Pitch line speed - Gear: 26.18 ft/min	
Sliding velocity $v_s = 276 \text{ ft/min}$	
Coefficient of friction: $0.038 \text{ if } v_s > 10 \text{ ft/min}$	
Forces: (lb)	
Tangential: 480	Gear Worm
Radial: 125	
Axial: 65	
Friction force, $W_f = 19.0 \text{ lb}$	
Power:	
Power output from gear: 0.381 hp	
Power loss - friction: 0.159 hp	
Power Input: 0.540 hp	
Efficiency: 70.6%	
Stresses: 0.540	Normal pressure angle, ϕ_n
Efficiency: 70.6%	$14.5 \quad 20 \quad 25 \quad 30$
Stresses: 0.540	Lewis form factor, y
Efficiency: 70.6%	$0.100 \quad 0.125 \quad 0.150 \quad 0.175$
Normal circular pitch: 0.521 in	
Dynamic factor, $K_v = 0.979$	
Bending Stress on Gear:	
Efficiency: 70.6%	8324 psi [Using effective gear face width]
Allowable stresses-Bronze: $Manganese = 17000 \text{ psi}; Phosphor = 24000 \text{ psi}$	
Surface Durability: [Hardened steel worm; bronze gear]	
Type of bronze: $D_g \rightarrow >2.5 \text{ in}$	$<2.5 \text{ in}$
Sand cast: $C_s = 857$	1000
Chill cast or forged: $C_s = 1093$	1000
Centrifugally cast: $C_s = 1126$	1000
Forge hardened sand cast: $C_s = 867$	Sand cast
Gear Ratio: $m_g = 6 to 20$	$20 to 76$
Ratio correction factor: $C_m = 0.759$	0.824
Efficiency: $C_e = 0.951$	
Sliding velocity: <700	$700-3000$
Velocity factor: $C_v = 0.486$	0.537
Efficiency: $C_e = 0.845$	
Rated tangential load: $W_{fr} = 1406 \text{ lb}$	OK For sand cast bronze
Must be $> W_f = 480 \text{ lb}$	
Can use Manganese bronze based on bending stress in gear.	
Changed worm diameter to 1.75 in ; Changed face width to 1.13 in	

CHAPTER 11

KEYS, COUPLINGS, AND SEALS

GENERAL NOTES FOR KEY DESIGN PROBLEMS 1-15:

FOR SAE 1018 CD STEEL: $S_y = 54000 \text{ psi}$. IF KEY MATERIAL IS WEAKEST -

$$\tau_d = \frac{0.5 S_y}{N} = \frac{0.5(54000)}{3} = 9000 \text{ psi}$$

$$\sigma_d = \frac{S_y}{N} = \frac{54000}{3} = 18000 \text{ psi}$$

1. $D_{SAFET} = 2.00 \text{ in.}$; USE $\frac{1}{2}$ IN SQ. KEY; SAE 1018 CD

$$L = \frac{2T}{\tau_d D W} = \frac{2(21000 \text{ lb/in})}{(9000 \text{ psi})(2.00 \text{ in})(0.5 \text{ in})} = 4.667 \text{ in}$$

BUT HUB LENGTH = 4.00 in. USE SAE 1045 CD; $S_y = 77000 \text{ psi}$
 $\tau_d = 0.5 S_y / N = 0.5(77) / 3 = 12.83 \text{ ksi}$

$$L = \frac{2(21000)}{(12.83)(2.00)0.5} = 3.27 \text{ in}; \text{ USE } L = 3\frac{3}{4} = 3.75 \text{ in.}$$

2. $D_s = 3.60 \text{ in.}$; USE $\frac{3}{8}$ IN SQUARE KEY; SAE 1018 CD

$$L = \frac{2(21000)}{(9000)(3.60)(0.825)} = 1.48 \text{ in} \quad \begin{matrix} \text{USE } L = 3.50 \text{ in. TO MORE} \\ \text{NEARLY MATCH HUB LENGTH} \end{matrix}$$

3. $D_s = 1.75 \text{ in.}$; USE $\frac{3}{8}$ IN. SQ. KEY; SAE 1018 CD; $\tau_d = 9000 \text{ psi}$

FOR HUB; CLASS 2D CI; $S_u = 20000 \text{ psi}$

FOR BEARING $\sigma_d = \frac{20000}{3} = 6667 \text{ psi}$ (CONSERVATIVE)

BECAUSE COMPRESSIVE STRENGTH OF CI IS MUCH GREATER
THAN TENSILE STRENGTH.

$$\text{SHEAR OF KEY: } L = \frac{2T}{\tau_d D W} = \frac{2(1112)}{(9000)(1.75)(1.375)} = 0.377 \text{ in}$$

$$\text{BEARING ON HUB: } L = \frac{4T}{\sigma_d D H} = \frac{4(1112)}{(6667)(1.75)(1.375)} = 1.02 \text{ in}$$

USE $L = 1.50 \text{ in.}$ TO MATCH HUB LENGTH.

4. $T = 63000(110) / 1700 = 4076 \text{ lb/in.}$; $D_s = 2.50 \text{ in.}$; USE $\frac{5}{8}$ SQ. KEY

$$L = \frac{2T}{\tau_d D W} = \frac{2(4076)}{(9000)(2.50)(0.625)} = 0.580 \text{ in}$$

USE $L = 2.50 \text{ in.}$ TO MORE NEARLY MATCH HUB LENGTH.

5. EXPRESS DATA FROM TABLE 11-6 AS $T = K D^2 L$
REQ'D $K = T / D^2 L$ ($L = \text{HUB LENGTH}$) USE B-FIT

a) PROB. 1 DATA; $T = 21000$; $D = 2.00\text{ in.}$; $L = 4.00\text{ in.}$

$$K = \frac{21000}{(2.00)^2(4.0)} = 131.3 \quad \text{TOO HIGH FOR ANY SPLINE IN TABLE 11-6}$$

b) PROB. 2 DATA; $T = 21000 \text{ lb-in}$; $D = 3.60\text{ in.}$; $L = 4.00\text{ in.}$

$$K = \frac{21000}{(3.60)^2(4.0)} = 405; \text{ USE 16 SPLINES}; K = 521$$

c) PROB. 3 DATA; $T = 1112 \text{ lb-in}$; $D = 1.75\text{ in.}$; $L = 1.75\text{ in.}$

$$K = \frac{1112}{(1.75)^2(1.75)} = 208 \quad \text{USE 6 SPLINES}$$

d) PROB. 4 DATA; $T = 4076 \text{ lb-in}$; $D = 2.50\text{ in.}$; $L = 3.25\text{ in.}$

$$K = \frac{4076}{(2.50)^2(3.25)} = 201 \quad \text{USE 6 SPLINES}$$

6. AT 220 hp; $T_2 = 63000(220)/1700 = 8163 \text{ lb-in}$

AT 110 hp; $T_1 = 63000(110)/1700 = 4076 \text{ lb-in}$

PIN SHOULD SHEAR AT T_2 ; $T_2 = S_{us} = S_u(0.75)$ (SECT. 2-2)

PIN SHOULD NOT YIELD AT T_1 ; $T_1 \leq S_y = S_u(0.5)$

FOR A GIVEN PIN d AND SHAFT D IN EQ. 11-18

$$S_y = T_1 = \frac{4T_1}{D\pi d^2} \quad ; \quad T_2 = \frac{4T_2}{D\pi d^2} = 0.75 S_u$$

$$\text{RATIO} \quad \frac{0.5S_y}{0.75S_u} = \frac{\frac{4T_1}{D\pi d^2}}{\frac{4T_2}{D\pi d^2}} = \frac{T_1}{T_2} : S_y = \frac{0.75T_1 S_u}{0.5T_2}$$

$$\text{MIN. } S_y = \frac{0.75(4076)S_u}{0.5(8163)} = 0.755 S_u \quad \begin{matrix} \text{MOST COLO DRAWN STEELS} \\ \text{HAVE } S_y \geq 0.75 S_u \end{matrix}$$

$$\text{FOR SAE 1018 CD.} \quad d = \sqrt{\frac{4T_2}{D\pi T_1}} = \sqrt{\frac{4(8163)}{0.50 \times \pi \times 1.5 \times 63000}} = 0.294 \text{ in.}$$

$$S_y = 54 \text{ ksi}; S_u = 64 \text{ ksi} \\ \text{AT } T_1 = 4076 \text{ lb-in.}; T_2 = \frac{4(4076)}{(2.50)(\pi)(0.294)^2} = 24001 \text{ psi} < \frac{S_y}{2} = \frac{54000 \text{ psi}}{2} = 27000 \text{ psi}$$

7. FROM EX PROB. 12-3: $T = 4168 \text{ LB-IN}$; $D_2 = 2\frac{1}{4} \text{ IN}$; $D_5 = 1\frac{1}{2} \text{ IN}$.
 SPROCKET: $\frac{1}{2} \text{ IN SQURE KEY; SAE 1018 CD}$

$$L = \frac{2T}{T_d D_W} = \frac{2(4168)}{(9000)(2.25)(0.5)} = 0.823 \text{ IN} \quad \text{USE } L = 1.00 \text{ IN}$$

WORM GEAR: $\frac{3}{8} \text{ SQ. KEY}$

$$L = \frac{2(4168)}{(9000)(1.50)(0.375)} = 1.647 \text{ IN.} \quad \text{USE } L = 1.75 \text{ IN.}$$

8.

WOODRUFF KEY 204: NOMINAL $w = \frac{2}{32} = \frac{1}{16} \text{ IN}$; NOMINAL $B = \frac{4}{8} = \frac{1}{2} \text{ IN}$
 ACTUAL DIMS. IN TABLE 11-3

9.

WOODRUFF KEY 1628: Nom. $w = \frac{16}{32} = \frac{1}{2} \text{ IN}$; Nom. $B = \frac{28}{8} = 3\frac{1}{2} \text{ IN}$

10, 11, 12 ARE DRAWINGS

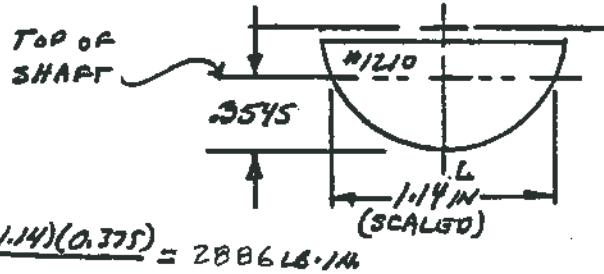

13.

$$T = F D / 2 \Rightarrow F = 2T/D$$

$$\text{key } w = \frac{3}{8}$$

$$A_s = Lw; T = \frac{F}{A_s} = \frac{2T}{DLw}$$

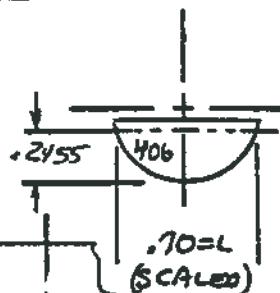

$$T = \frac{T_d DLw}{2} = \frac{(9000)(1.50)(1.14)(0.375)}{2} = 2886 \text{ LB-IN}$$

14.

$$T = \frac{T_d DLw}{2} = \frac{(9000)(1.50)(0.70)(0.125)}{2} = 197 \text{ LB-IN}$$

$$\text{KEY } w = \frac{4}{8} \text{ IN}$$

15.

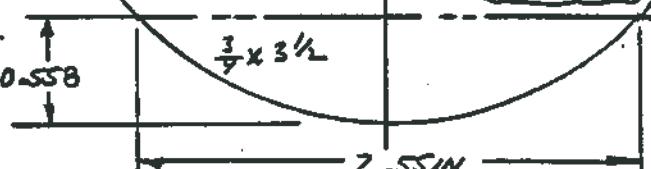

$$T = \frac{(9000)(3.25)(2.55)(0.75)}{2} = 27,970 \text{ LB-IN}$$

16.

$$\text{a.) } T = \frac{1}{3} D^2 = \frac{1}{3} (1.50)^2 \quad (\text{PROB 16}) \quad 0.558 \\ = 313 \text{ LB-IN / IN OF HUB L.}$$

$$\text{b.) } T = \frac{326 D^2}{3} = \frac{326}{3} (3.50)^2 \\ = 3994 \text{ LB-IN / IN OF HUB L.} \quad (\text{PROB 17})$$

$$\text{c.) } T = \frac{688 D^2}{3} = \frac{688}{3} (2.500)^2 = 4300 \text{ LB-IN / IN OF HUB L.} \quad (\text{PROB 18})$$

NOTE: Problems 20-46 call for narrative answers for which the proper information can be found in the text. Guidance is provided below for sections in which additional information can be found.

20. Section 11-6 includes discussion of applying set screws to transmit torque. A table of approximate holding force capacity vs. set screw size is provided.
21. Press fit is described briefly in Section 11-6. More discussion follows in Chapter 13.
22. Section 11-7 describes both rigid and flexible couplings and compares their performance. Examples of commercially available couplings are shown and described.
23. Section 11-8 contains general information about universal joints.
24. Section 11-9 contains general information about retaining rings and other means of locating machine elements axially on shafts and in other devices. Included are collars, shoulders, spacers, and locknuts.
25. to 38. Section 11-10 contains general information about seals.
39. to 46. Section 11-11 contains general information about seal materials, including elastomers.

40. to 45. A list of 14 elastomers is included in Section 11-11. Following the list of 14, elastomers, their general performance capabilities are described.

46. The required conditions for shafts on which elastomeric seals operate are discussed in the last part of Section 11-11. Examples are:
 - Steels, hardened to HRC 30 with tolerances of less than ± 0.005 in (0.13 mm) are typically used for shafts on which seals operate. The surface must be free of burrs with a surface finish of 10 to 20 microinches is recommended. Lubrication is recommended.

CHAPTER 12

SHAFT DESIGN

GENERAL NOTES CONCERNING SOLUTIONS TO SHAFT DESIGN PROBLEMS

- Design values for stress concentrations as given in Section 12-4 are used for the initial calculations. These values must be checked once final design details are specified for diameters, fillet radii, and other features.
- Estimates are originally used for the size factors used in calculations because they depend on the shaft sizes that are unknown at the start of a design problem. These values must be checked once final design decisions have been specified.
- The choice of the reliability factor, C_R , is a design decision. Other values may be preferred.
- In most cases, the proposed final values for diameters are expected to be safe because trial values are typically conservative and because final specified diameters are typically made to the next larger preferred size according to Appendix Table A-2.
- Final specifications for diameters where bearings are to be mounted must await the selections for suitable bearings that can accommodate the radial and thrust loads applied to them. This process is described in Chapter 14 and the MDESIGN – MOTT software is an excellent tool for making those decisions. The computed ‘minimum required diameter’ from the shaft design process should be used as to limit the bearing selection to only feasible sizes.

Shafts with Only Radial Loads Applied to Them:

Problems P1 through P30 relate to one of the Figures P12-1 through P12-17 showing shafts carrying a variety of combinations of gears, belt sheaves, chain sprockets, and a few other items such as a flywheel and a propeller-type fan. All of these elements apply only radial loads to the shafts on which they are mounted.

- Problems 1-11 include only forces and torques exerted by gears on shafts. No separate solutions for these problems are included here.
- Problems 12-21 include only forces and torques exerted by belt drives and chain drives on shafts. No separate solutions are included here.
- Problems 22-30 are comprehensive design problems that use the same shaft assemblies that are used for Problems 1-21. The solutions to these problems include the analyses of forces and torques and should be used as the solutions for problems 1-21.
- The parts of the solutions for torques and forces give discrete, single-answers.
- The remaining parts of the comprehensive shaft designs include many design decisions and multiple solutions are possible. The given solutions should be considered examples only.

There are multiple ways in which the problems P1 through P30 may be assigned. The following table may help instructors decide how to assign the problems for student solution and may help students

comprehend how the sets of problems lead to the more general shaft design. Any combination of problems may be chosen.

<u>Torques and Forces Acting Radial to Shaft</u>	<u>Comprehensive</u>
Figure P12-1: P1 – Gear B; P14 – Sheave D	P22
Figure P12-2: P2 – Gear C; P12 – Sprocket D; P13 – Pulley A	P23
Figure P12-3: P3 – Gear B; P15 – Sprocket C; P16 – Sheaves D, E	P24
Figure P12-4: P4 – Gear A; P19 – Sprockets C, D	P25
Figure P12-5: P5 – Gear D; P20 – Sheave A; P21 – Sprocket E	P26
Figure P12-6: P6 – Gear E; (No separate analysis of Sheave A)	P27 (Includes Sheave A)
Figure P12-7: P7 – Gear C; P8 – Gear A	P28 (Includes Sheaves D, E)
Figure P12-9: P9 – Gear C; P10 – Gear D; P11 – Gear F	P29 (Includes Sheave B)
Figure P12-17: P17 – Sheave C; P18 – Pulley D	P30 (Includes Fan A)

Shafts with both Radial and Axial Loads Applied to Them:

Problems P31 to P34 deal with shafts carrying helical gears and wormgears that produce forces directed axially in addition to radial forces. Solutions are only shown for the comprehensive problems (12-32 and 12-34) in which the details of the analyses of torques and forces are included.

<u>Torques and Forces Acting Radial and Axial to Shaft</u>	<u>Comprehensive</u>

Figure P12-33: P33 – Wormgear C	P34 (Includes Sheave A)

Other Comprehensive Design Problems

Problems 35 to 41 contain a variety of loading situations for which the general solution procedure must be adapted. Some of the problems involve more than one shaft, considering shafts for mating gears and multiple reductions.

Figure P12-35: P35 – Double reduction helical drive

SPEED: $m_C = m_3 \cdot \frac{24}{10.6} = 128 \cdot \frac{24}{10.6} = 50.6 \text{ RPM} ; T_C = 63000(1/2)/50.6 = 14,932 \text{ LB-IN}$

40

FIGURE P12-40: SHAFT Z : M = 480 RPM : POWER IN AT C = 22.5 kW.
POWER OUT AT A = 15 kW : POWER OUT AT E = 7.5 kW.

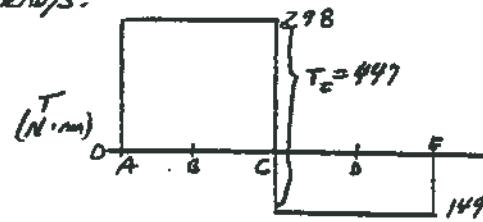

COAL CRUSHER - USE N=4 BECAUSE OF IMPACT AND SHOCK.

$$N = 480 \frac{\text{REV}}{\text{MIN.}} \times \frac{2\pi \text{RAD}}{\text{REV.}} \times \frac{1 \text{MIN.}}{60 \text{SEC.}} = 50.27 \text{ RAD/S.}$$

$$T_{AC} = \frac{P}{N} = \frac{15 \times 10^3 \text{ N.m/s}}{50.27 \text{ RAD/s}} = 298 \text{ N.m}$$

$$T_{CE} = \frac{P}{N} = \frac{7.5 \times 10^3 \text{ N.m/s}}{50.27 \text{ RAD/s}} = 149 \text{ N.m}$$

$$\text{TORQUE ON GEAR C} = \frac{22.5 \times 10^3 \text{ N.m/s}}{50.27 \text{ RAD/s}} = 447 \text{ N.m}$$

TORQUE IN SHAFT

FORCES:

$$\text{GEAR A: } W_{RA} = \frac{T_A}{r_A} = \frac{298 \text{ N.m} \times 10^3 \text{ mm}}{50 \text{ mm}} = 5960 \text{ N} \leftarrow$$

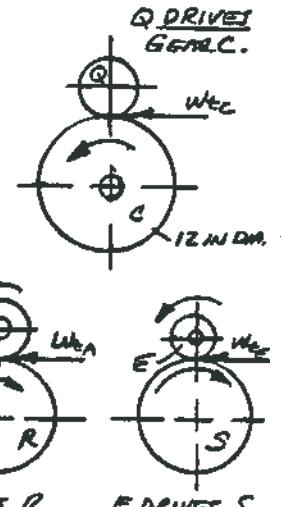

$$W_{RA} = W_{CA} \tan 20^\circ = (5960 \text{ N}) \tan 20^\circ = 2169 \text{ N} \uparrow$$

$$\text{GEAR C: } W_{RC} = \frac{T_C}{r_C} = \frac{447 \text{ N.m} \times 10^3}{150 \text{ mm}} = 2980 \text{ N} \leftarrow$$

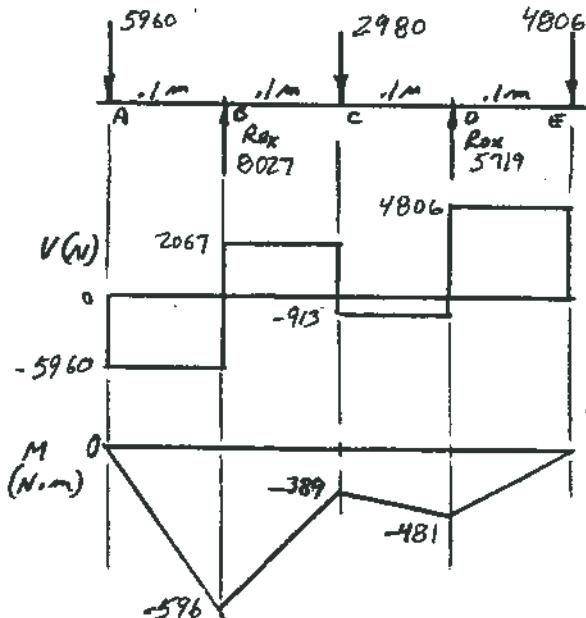

$$W_{RC} = W_{RC} \tan 20^\circ = (2980 \text{ N}) \tan 20^\circ = 1065 \text{ N} \uparrow$$

$$\text{GEAR E: } W_{RE} = \frac{T_E}{r_E} = \frac{149 \text{ N.m} \times 10^3}{31 \text{ mm}} = 4806 \text{ N} \rightarrow$$

$$W_{RE} = W_{RE} \tan 20^\circ = (4806 \text{ N}) \tan 20^\circ = 1749 \text{ N} \uparrow$$

HORIZONTAL PLANE

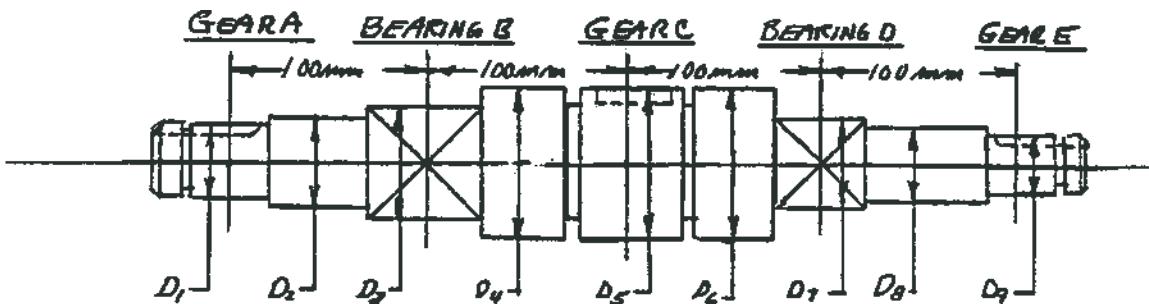

$$M_B = [596^2 + 217^2]^{1/2} = 634 \text{ N.m} ; M_C = [389^2 + 249^2] = 462 \text{ N.m} ; M_D = [401^2 + 175^2] = 512 \text{ N.m}$$

46

CONTINUED

BEARING FORCES: $R_B = \sqrt{8027^2 + 1846^2} = 8237 \text{ N}$; $R_D = \sqrt{5719^2 + 1006^2} = 5807 \text{ N}$

PROPOSED SHAFT DESIGN:

ASSUME ALL FILLETS ARE SMALL RADIES WITH $K_t \approx 2.5$, EXCEPT R_2, R_6
USE $K_t = 3.0$ AT RING GROOVES WITH SHAFT DIA. $\geq 1.06 \times$ GROOVE DIA.
USE $K_t = 1.5$ AT R_2 AND R_6 (WELL ROUNDED)

MATERIAL SELECTION: SAE 4140 QQT 1000, $S_u = 1160 \text{ MPa}$, $S_y = 1080 \text{ MPa}$

17% ELONGATION - GOOD STRENGTH AND DUCTILITY.

FROM FIG. 5-9: $S_m = 400 \text{ MPa}$.

SELECT $C_s = 0.80$ (FOR $D \leq 65 \text{ mm}$ OR LESS); $C_r = 0.81$ (0.99 RELIABILITY)

$$S_m' = C_s C_r S_m = (0.80)(0.81)(400 \text{ MPa}) = 259 \text{ MPa} = 259 \text{ N/mm}^2$$

SOLUTION FOR DIAMETERS USING EQ. 9-22 - SUMMARY: (N=4)

LOCATION	K_t	$M(\text{N-mm})$	$T(\text{N-mm})$	D_{MIN}	SPECIFIED D
D_1	2.5	0	298,000	21.56	50.0 mm
D_2	1.15	634,000	298,000	53.13	60.0 mm
D_3	2.5	634,000	298,000	62.96	65.0 mm
D_4	3.0	525,000*	298,000	62.82 $\times 1.06 = 66.6$	80.0 mm
D_5	2.5	462,000	298,000	58.67	
D_6	3.0	462,000	149,000	60.19 $\times 1.06 = 63.8$	60.0 mm
D_7	2.5	512,000	149,000	58.62	60.0 mm
D_8	1.5	512,000	149,000	49.45	55.0 mm
D_9	2.5	0	199,000	17.11	45.0 mm

NOTES: D_2 AND D_7 ARE STANDARD BEARING BORES FROM TABLE 14-3.

*MOMENT AT D_4 ESTIMATED BETWEEN POINTS B AND C.

80.0 mm USED FOR D_4, D_5 , AND D_6 TO PROVIDE SHOULDER FOR BEARINGS AT B AND D.

D_2 AND D_8 PROVIDE EASE OF INSTALLATION FOR BEARINGS.

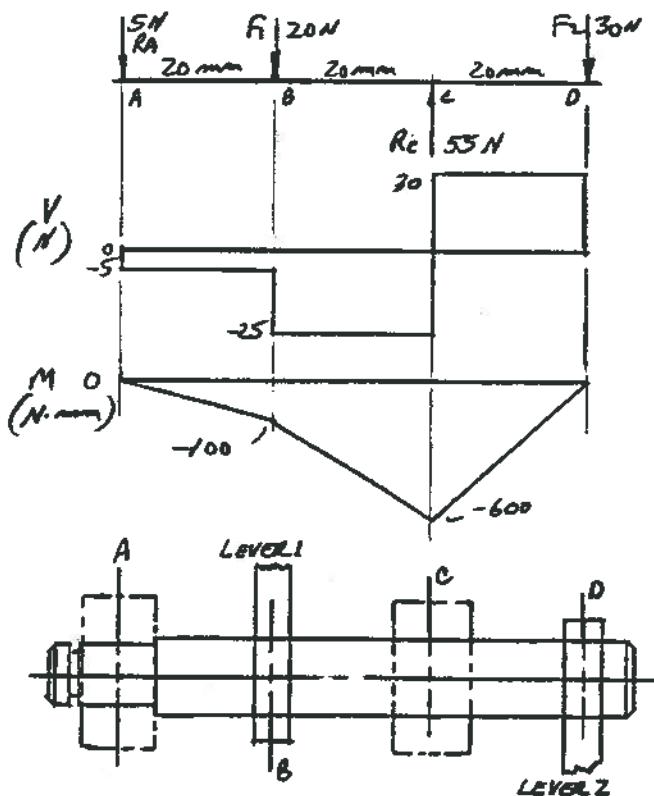

D_1 AND D_9 MADE LARGER THAN REQUIRED FOR COMPATIBILITY WITH ADJACENT DIAMETERS AND TO WITHSTAND MOMENTS AT SHOULDERS.

FINAL STRESSES MUST BE CHECKED AFTER SPECIFYING FILLET RADII, GROOVE GEOMETRY, AND BEARING SELECTION.

17

FIGURE P12-41 DESIGN SHAFT AND LEVERS. $F_1 = 20N$

$$F_2 = F_1(60\text{mm})/40\text{mm} = 30N; \text{TORQUE} = F_1 \cdot 60 = 1200\text{N}\cdot\text{mm} \text{ FROM B TO D.}$$

USE SAE 1137 CD STEEL

$$S_u = 676\text{MPa}; S_y = 565\text{MPa}$$

$$S_{ut} = 260\text{MPa} \text{ (FIG. 5-8)}$$

$$\text{LET } C_s = 0.9, C_t = 0.75$$

$$S_m' = (6.9)(0.75)(260) = 175\text{MPa}$$

WIPER MECHANISM HAS AN OSCILLATING MOTION. BOTH BENDING AND TORSION WILL BE VARYING.

SHAFT RESTRAINED IN BEARING AT A BUT CAN FLOAT IN BEARING C.

ASSUME $K_c = 2.5$ AT PILLET TO RIGHT OF A. ASSUME $K_t = 1.0$ AT C.

ASSUME LEVERS ARE INSTALLED WITH A LIGHT PRESS FIT AND TACK WELDED IN POSITION. USE $C_b = 3.0$ FOR WELD AREA.

DESIGN EQUATION 12-24 MUST BE MODIFIED FOR VARYING TORQUE.

ADD K_t FOR TORSION. SUBSTITUTE S_m' FOR S_y . THEN:

$$D = \left[\frac{32N}{\pi} \sqrt{\frac{(K_{cb}M)^2 + 3(K_{ct}T)^2}{S_m'^2}} \right]^{1/3}$$

AT C:

$$D = \left[\frac{32(3)}{\pi} \sqrt{\frac{(1.0(600))^2 + 3(1.0(1200))^2}{175^2}} \right]^{1/3} = 5.94\text{mm}$$

AT B:

$$D = \left[\frac{32(3)}{\pi} \sqrt{\frac{(3.0(100))^2 + 3(3.0(1200))^2}{175^2}} \right]^{1/3} = 8.18\text{mm}$$

USE $D = 10.0\text{mm}$
AT B, C, D.
USE $D = 8.0\text{mm}$
AT A.

LEVER DESIGN: USE FLAT STOCK, 4.0 mm THICK = 6

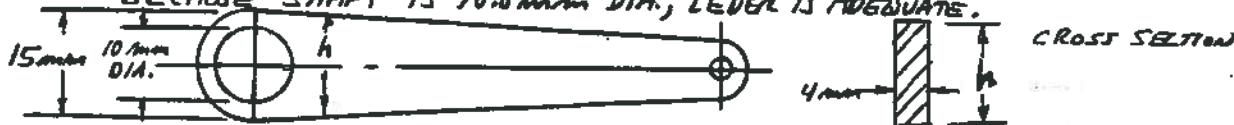

SAME MATERIAL AS SHAFT: $S_m' = 175\text{MPa}$; $\sigma_b = \frac{S_m'}{N} = \frac{175}{3} = 58.3\text{MPa}$

$$M_{max} = (20\text{N})(60\text{mm}) = 1200\text{N}\cdot\text{mm}; \sigma = N/S$$

$$\text{REQ'D } S = \frac{M}{C_b} = \frac{1200\text{N}\cdot\text{mm}}{58.3\text{N/mm}} = 20.57\text{mm}^3 = bh^3/6$$

$$\text{REQ'D } h = \sqrt{6S/b} = \sqrt{6(20.57\text{mm}^3)/4.0\text{mm}} = 5.55\text{mm} \text{ AT SHAFT.}$$

BECAUSE SHAFT IS 10.0 mm DIA, LEVER IS ADEQUATE.

28. LEAD ANGLE $\lambda = \tan^{-1} \left(\frac{L}{\pi D_p} \right) = \tan^{-1} \left(\frac{3.0}{\pi(12.5)} \right) = 4.37^\circ$

29. EFFICIENCY $\epsilon = \frac{F L}{2\pi T_u} = \frac{8500 \text{ N} (3.0 \text{ mm})}{2\pi (12167 \text{ N.mm})} = 0.334 = 33.4\%$

30. BALL SCREW FROM PROBLEM 14, $3/4\text{-}2$, LENGTH = 28.0 IN
FIND ESTIMATE OF CRITICAL SPEED. EQ. 17-15

$$M_c (\text{RPM}) = \frac{476 \times 10^6 d K_s}{(\text{SF}) L^2}$$

d = MINOR DIA. OF SCREW. THIS VALUE NOT AVAILABLE IN THIS BOOK, OR ON INTERNET SITE 10. AS AN ESTIMATE, USE MINOR DIA. FOR A $3/4$ ACME SCREW - $d \approx 0.55\text{IN}$ - FROM MACHINERY'S HANDBOOK, 28TH ED., P. 1830.

L = 28.0 IN - BETWEEN SINGLE BEARINGS AT ENDS

$$K_s = 1.00$$

LET SF = 1.0 TO ESTIMATE CRITICAL SPEED.

$$M_c = \frac{476 \times 10^6 (0.55\text{in})(1.0)}{11 (28.0\text{in})^2} = 3339 \text{ RPM}$$

SAFE OPERATING SPEED - SF = 3.0

$$M_{\text{OPER}} = \frac{M_c}{SF} = \frac{3339 \text{ RPM}}{3} = 1113 \text{ RPM}$$

CHAPTER 18 SPRINGS

1 $k = \Delta F / \Delta L = 12.0 / (2.75 - 1.85) = 13.3 \text{ lb/in.}$

2 $k = \frac{F_0 - 0}{L_f - L_0} ; L_f - L_0 = \frac{F_0}{k} ; L_f = L_0 + \frac{F_0}{k} = 1.25 + \frac{4.65 \text{ lb}}{13.3 \text{ lb/in.}} = 1.497 \text{ in.}$

3 $k = \frac{F_s - F_0}{L_s - L_0} ; F_s = k(L_0 - L_s) + F_0 = 76.7(0.830 - 0.626) + 32.2 = 47.8 \text{ lb} = F_s$
 $L_s = L_0 + \frac{F_0}{k} = 0.830 + \frac{32.2}{76.7} = 1.25 \text{ in} = L_s$

4 $k = \Delta F / \Delta L = 99.2 \text{ N} / (63.5 - 37.1) \text{ mm} = 3.76 \text{ N/mm}$

5 $L_f = L_0 + \frac{F_0}{k} = 39.47 \text{ mm} + \frac{54.05 \text{ N}}{3.76 \text{ N/mm}} = 76.24 \text{ mm}$

6 $F_s = k(L_0 - L_s) + F_0 = 8.95(29.4 - 21.4) + 134 \text{ N} = 205.6 \text{ N} = F_s$
 $L_s = L_0 + \frac{F_0}{k} = 29.4 + \frac{134}{8.95} = 44.4 \text{ mm} = L_s$

7 $ID = OD - 2D_N = 1.100 - 2(0.085) = 0.93 \text{ in} = ID$
 $D_m = OD - D_N = 1.100 - 0.085 = 1.015 \text{ in} = D_m$
 $C = D_m / D_N = 1.015 / 0.085 = 11.94 = C$
 $L_s = ND_N ; N = L_s / D_N = 0.563 / 0.085 = 6.6 \text{ coils}$

8 $D_m = OD - D_N = 0.560 - 0.059 = 0.501 \text{ in} ; C = D_m / D_m = 0.501 / 0.059 = 8.49 = C$
 $L_s = \mu N_a + 2D_m ; N_a = N - 2 = 19 - 2 = 17 \text{ ACTIVE COILS}$
 $\mu = \frac{L_s - 2D_m}{N_a} = \frac{4.22 - 2(0.059)}{17} = 0.241 \text{ in} = \mu$
 $\lambda = \tan^{-1} \left(\frac{\mu}{\pi D_m} \right) = \tan^{-1} \left(\frac{0.241}{\pi(0.501)} \right) = 8.70 \text{ degrees} = \lambda$
 $L_s = ND_N = 19(0.059) = 1.12 \text{ in.} = L_s$

9 FROM EQ19-6: $F_o = \frac{S_o G D_w}{8C^3 N_a} = \frac{(4.22 - 3.10)(11.85 \times 10^6)(0.059)}{8(0.49)^3(17)} = 10,25 \text{ LB} = F_o$

EQ.19-4: $T_o = \frac{8k F_o C}{\pi D_w^2} = \frac{8(1.17)(10,25) \times 8.49}{\pi (0.059)^2} = 74,500 \text{ PSI} = T_o$

$$K = \frac{4C-1}{4C-4} + \frac{0.615}{C} = \frac{4(0.49)-1}{4(0.49)-4} + \frac{0.615}{8.49} = 1.17$$

FROM FIGURE 18-9: MUSIC WIRE: $T_d = 132,000 \text{ PSI}$ FOR AVG. SERVICE - OK.

10. $L_f/D_m = 4.22/0.501 = 8.42$: From FIG 19-15, CURVE A, $(S_o/L_f)_{cr} = 0.18$

$$(S_o)_{cr} = 0.18 L_f = 0.18(4.22) = 0.76 \text{ IN}$$

ACTUAL $L_f = 4.22 - 3.00 = 1.22 \text{ IN} > 0.76 \text{ IN}$ - BUCKLING SHOULD OCCUR

11. (EQ.19-3) $(OD)_s = \sqrt{D_m^2 + \frac{\mu - D_m^2}{\pi^2}} + D_w = \sqrt{(501)^2 + \frac{0.241(0.059)^2}{\pi^2}} + .059 = 2583 \text{ IN}$

12. $F_s = k(L_f - L_s) = 8.40(4.22 - 1.12) = 26,05 \text{ LB}$

FROM PROB. 9: $k = \frac{F_o}{L_f - L_s} = \frac{10.25}{4.22 - 3.00} = 8.40 \text{ LB/in}$

$$T_s = T_o \times \frac{F_s}{F_o} = 74,500 \text{ PSI} \times \frac{26,05}{10.25} = 189,300 \text{ PSI, TOO HIGH}$$

FROM FIG 19-9, LIGHT SERVICE, $T_d = 147,000 \text{ PSI} = \text{APPROX. 5V}$

Notes concerning Problems 13 - 35: Most of these problems are design problems. No single unique solutions exist. Sample solutions are shown.

Problems 13 through 24 are compression springs. Problem 13 is done by both methods 1 and 2 as outlined in the text. Others are done by one or the other method. In some problems only summary results are shown.

Problems 25 through 31 are extension springs. Problem 25 is worked out in detail. Problems 26 through 30 were designed with the aid of a computer program using the same procedure. Only summary results are shown. Problem 31 is the stress analysis of the ends of the spring.

Problems 32 through 35 are torsion springs. In each case, the design of each end is required. It was assumed that ends would be straight with lengths L_1 and L_2 as shown. The effects of the ends on the spring rate were then included in the analysis.

13 METHOD 1 $F_o = 220 \text{ LB}; F_i = 180 \text{ LB}; \Delta F = 220 - 180 = 40 \text{ LB}; \Delta L = 0.50 \text{ IN.}$

STEP 1 - ASTM A229; SEVERE SERVICE; $G = 11.2 \times 10^6 \text{ PSI}$

STEPS 2-5 - LET $L_i = 3.00 \text{ IN.}; D_m = 3.00 \text{ IN. (DESIGN DECISIONS)}$

$$k = \Delta F / \Delta L = 40 \text{ LB} / 0.50 \text{ IN} = 80 \text{ LB/IN}$$

$$L_f = L_i + F_i / k = 3.00 + 180 / 80 = 5.25 \text{ IN}$$

$$L_o = L_i - \Delta L = 3.00 - 0.50 = 2.50 \text{ IN}$$

$$f_o = L_f - L_o = 5.25 - 2.50 = 2.75 \text{ IN}$$

STEP 6 - ASSUME $T_d = 80,000 \text{ PSI}$

STEP 7 - (EQ. 18-7)

$$D_{nr} = \left[\frac{(3.06)(F_o)(D_m)}{T_d} \right]^{1/3} = \left[\frac{3.06(220)(3.00)}{80,000} \right]^{1/3} = 0.293 \text{ IN.}$$

STEP 8 - SELECT $D_{nr} = 0.3065 \text{ IN. U.S. GAGE 0.5}; T_d = 78 \text{ KSI}; T_{MAX} = 104 \text{ KSI}$

STEP 9 - $C = D_m / D_{nr} = 3.00 / 0.3065 = 9.79; K = 1.15 (\text{FIG. 1B-14})$

STEP 10 -

$$T_o = \frac{8K F_o D_m}{\pi D_{nr}^3} = \frac{8(1.15)(220)(3.00)}{\pi(0.3065)^3} = 67126 \text{ PSI OK}$$

$$\text{STEP 11} - N_a = \frac{G D_{nr}}{8 K C^3} = \frac{(11.2 \times 10^6)(0.3065)}{8(80)(9.79)^3} = 5.72 \text{ COILS}$$

$$\text{STEP 12} - L_s = D_{nr}(N_a + 2) = 0.3065(5.72 + 2) = 2.365 \text{ IN}$$

$$F_s = k(L_f - L_s) = 80(5.25 - 2.365) = 231 \text{ LB}$$

$$T_s = T_o(F_s/F_o) = 67126(231/220) = 70420 \text{ PSI OK}$$

$$\text{STEP 13} - D_o = D_m + D_{nr} = 3.00 + 0.3065 = 3.3065 \text{ IN.}$$

$$D_i = D_m - D_{nr} = 3.00 - 0.3065 = 2.694 \text{ IN.}$$

SUMMARY: $D_{nr} = 0.3065 \text{ IN.}; L_f = 5.25 \text{ IN.}; L_o = 2.50 \text{ IN.}; D_m = 3.00 \text{ IN.}$

13 METHOD 2 PROCESS STARTS SAME AS METHOD 1 WITHOUT D_m .

STEP 2 - (EQ. 18-10) $D_{nr} = \sqrt[3]{21.4 F_o / T_d} = \sqrt[3]{21.4(220) / 80,000} = 0.243 \text{ IN}$

STEP 3 - TRY $D_{nr} = 0.2625 \text{ IN. U.S. GAGE 2}; T_d = 80,000 \text{ PSI}$

STEP 4 - (EQ. 18-11)

$$N_{a_{MAX}} = (L_o - 2D_{nr}) / D_{nr} = [2.50 - 2(0.2625)] / 0.2625 = 7.5 \text{ COILS}$$

$$\text{STEP 6} - (\text{EQ. 19-12}) C = \left[\frac{G D_{nr}}{8 K N_a} \right]^{1/3} = \left[\frac{(11.2 \times 10^6)(0.2625)}{8(80)(6.0)} \right]^{1/3} = 9.15 \quad \text{STEP 5}$$

$$K = 1.16 (\text{FIG. 7-12})$$

$$(\text{EQ. 19-4}) \quad \text{STEP 8} - T_o = \left(\frac{8 K C F_o}{\pi D_{nr}^3} \right) = \frac{2.546(1.16)(9.15)(220)}{(0.2625)^3} = 86262 \text{ PSI } \left\{ \begin{array}{l} \text{TOO} \\ \text{HIGH} \end{array} \right\}$$

REPEAT FROM STEP 3 : TRY $D_{nr} = 0.2830 \text{ IN. U.S. GAGE 1}; T_d = 79,000 \text{ PSI}$

(CONTINUED - NEXT PAGE)

$T_{MAX} = 104,000 \text{ PSI}$

CHAPTER 21

ELECTRIC MOTORS AND CONTROLS

Questions 1 - 8: See Sections 21-2 and 21-3.

9. Standard frequency for AC power in the U.S. is 60 hertz.
10. Standard frequency for AC power in Europe is 50 hertz.
11. Single phase AC power at 115 and 230 volts.
12. Two conductors plus a ground wire.
13. 480V, three phase is preferred because the current would be lower and the size of the motor would be smaller.
14. Synchronous speed is the speed at which an AC motor tends to run at zero load. $n_s = 120(f)/p$, where f is the frequency of the power and p is the number of poles in the motor.
15. Full-load speed is the speed of the motor when it is delivering its rated torque.
16. In U.S.: $n_s = 120(f)/p = 120(60)/4 = 1800$ rpm
In France: $n_s = 120(f)/p = 120(50)/4 = 1500$ rpm
17. 2-pole motor. Zero-load speed approximately 3600 rpm.
18. $n_s = 120(f)/p = 120(400)/4 = 12000$ rpm
19. Two speed motor; 1725 rpm and 1140 rpm
20. Variable frequency control
- 21,22,24 - See Section 21-8.
23. National Electrical Manufacturers Association
25. TEFC - Totally enclosed - fan-cooled. See Section 21-8.
26. TENV - Totally enclosed - non-ventilated. Section 21-8.
27. NEMA Design 9 - Hazardous locations. Flour can explode.
28. TENV because motor may get bathed in water during cleaning and to protect food from contaminants from the motor.

30. Locked rotor torque is the torque that a motor can exert when the rotor is at rest. Also called starting torque.
31. A poorer speed regulation means that the motor would slow down more when subjected to an increase in torque.
32. Breakdown torque is the maximum torque a motor can develop during the increase in speed after start or the torque at which a motor would be stalled if the torque is increased after it is running.
33. Split-phase; capacitor-start; permanent-split capacitor; shaded pole.
34. a) Single phase, split-phase AC motor because of the moderate starting torque and the change of torque when the switch cuts out the starting winding.
- b) From Table 21-2, full-load speed = 1140 rpm
 $T = 63000(P)/n = 63000(.75)/1140 = 41.4 \text{ lb-in}$
- c) Starting torque = 150% (F.L. torque)
 $T_s = 1.5(41.4) = 62.2 \text{ lb-in (approximate)}$
- d) Breakdown = 350% (F.L. torque)
 $T_b = 3.5(41.4) = 145 \text{ lb-in (approximate)}$
35. 2-pole; 1.50 kW rated power.
- b) From Table 21-2, full-load speed = 3450 rpm
 $n = (3450 \text{ rev/min}) (2\pi \text{ rad/rev}) (1 \text{ min}/60 \text{ s}) = 361 \text{ rad/s}$
 $T = P/n = (1.5 \times 10^3 \text{ N-m/s}) / (361 \text{ rad/s}) = 4.15 \text{ N-m}$
- c) Starting torque = 1.5(4.15 N-m) = 6.23 N-m
- d) Breakdown torque = 3.5(4.15 N-m) = 14.5 N-m
36. Fan requires about 18 lb-in of torque at 1725 rpm; low starting torque; assume fan cools motor. Recommend 4-pole, single phase permanent split capacitor AC motor.
 $\text{Power} = Tn/63000 = (18)(1725)/63000 = 0.49 \text{ hp (use 1/2 hp)}$
37. Full load torque about 0.5 N-m at 3450 rpm; high starting torque (about 2.8xF.L.T.) due to starting compressor against high pressure in the system. Recommend capacitor start, single phase, 2-pole, AC motor.
 $n = (3450 \text{ rev/min}) (2\pi \text{ rad/rev}) (1 \text{ min}/60 \text{ s}) = 361 \text{ rad/s}$
 $P = Tn = (0.5 \text{ N-m})(361 \text{ rad/s}) = 181 \text{ N-m/s} = 181 \text{ watts}$
38. Speed is adjusted by varying the resistance in the rotor circuit through an external resistance control.
39. F.L. speed = synchronous speed = 720 rpm. (Table 21-2)

40. Pull-out torque is the torque that would disengage the motor from its synchronous speed and cause it to stop.
41. Universal motors are very small and light weight for a given power rating. Some vacuums, appliances, and hand tools utilize the high speed of rotation effectively.
42. A universal motor can operate on DC or almost any frequency of AC voltage when operating near its full-load point.
43. Batteries, generators, rectified AC, HYDROGEN FUEL CELLS.
44. See Table 24-7.
45. SCR - Silicon controlled rectifier. Used to produce DC power from AC.
46. SCR controls do not produce pure DC power; it has some variation, called ripple, due to the AC input. A low-ripple control would produce a nearly true DC power.
47. Could use a 90V DC motor powered from a NEMA Type K SCR power supply to convert 115 V AC to 90V DC power.
- 48-50. See Section 24-11.
51. The motor would speed up without limit and may fail catastrophically.
52. Speed is proportional to torque. $T_2 = T_1 \left(\frac{n_1}{n_2} \right)$
 $T_2 = (15.0 \text{ N-m}) (3000/2200) = 20.5 \text{ N-m}$
- 53, 56-61. See Sections 24-9, 24-11, and 24-12.
54. NEMA Size 2 motor starter for 10 hp, 220V AC, 3-phase.
55. NEMA Size 1 motor starter for 1.0 kW, 110V AC, single phase.

CHAPTER 22

MOTION CONTROL: CLUTCHES AND BRAKES

1. FROM EQ. 22-1: $T = C PK/m = (63025)(5.0)(2.75)/1750 = 495 \text{ LB-IN}$
 C AND K FROM SECTION 22-4.
