2. Work from left to right. Write the name of the threedigit number in each period, followed by the name of the period and a comma. Do not write the name of the last period, "ones."
a. twenty-seven thousand, one hundred forty-three
b. five hundred twenty-one million, six hundred thirty thousand, fifty-seven
3. a. Begin by noting how to write the number within each period.
$\overbrace{\text { fifty-three }}^{53}$ thousand, $\overbrace{\text { four hundred six }}^{406}$
Write the digits for the number in each period,
followed by a comma.
The standard form for the number is 53,406 .
b. Begin by noting how to write the number within each period.
$\overbrace{\text { two hundred four million, }}^{204} \overbrace{\text { nine hundred thirty-two thousand, }}^{932} \overbrace{\text { sixteen }}^{016}$
Write the digits for the number in each period, followed by a comma.
The standard form for the number is $204,932,016$.
4. a. The place value chart shows that 704,663 contains 7 hundred-thousands, 0 ten-thousands, 4 thousands, 6 hundreds, 6 tens, and 3 ones. Thus 704,663 is written in expanded form as follows: $704,663=700,000+4000+600+60+3$.
b. The place value chart shows that 49,063,400 contains 4 ten-millions, 9 millions, 0 hundred-thousands, 6 tenthousands, 3 thousands, 4 hundreds, 0 tens, and 0 ones. Thus $49,063,400$ is written in expanded form as follows: $49,063,400=40,000,000+9,000,000+60,000+3000+400$.
5. a. $14>5$ because 14 is to the right of 5 on the number line.
b. $0<16$ because 0 is to the left of 16 on the number line.
6. a. The digit to the right of the thousands digit is 4 , which is less than 5 . This indicates to leave the thousands digit the same. Replace all digits to the right with zeros.
$57,498 \approx 57,000$
b. The digit to the right of the hundred-thousands digit is 5 . This indicates to add one to the hundred-thousands digit. Replace all digits to the right with zeros.
$4,856,902 \approx 4,900,000$
c. The digit to the right of the thousands digit is 6 , which is greater than 5 . This implies to add one to the thousands digit. Replace all digits to the right with zeros.
$9602 \approx 10,000$
d. The digit to the right of the millions digit is 2 , which is less than 5 . This implies to leave the millions digit the same. Replace all digits to the right with zeros.
$684,236,042 \approx 684,000,000$
7. a. The digit to the right of the billions digit is 0 , which is less than 5 . This implies to leave the billions digit the same. Replace all digits to the right with zeros.
$7,058,746,857 \approx 7,000,000,000$
b. The digit to the right of the ten-thousands digit is 6 , which is greater than 5 . This implies to add one to the tenthousands digit. Replace all digits to the right with zeros.
$7,058,746,857 \approx 7,058,750,000$
8. a. The cost of a coronary bypass in the United States is $\$ 67,583$
b. The country with the least amount in the CT scan column is India.

The average cost for this procedure in India is $\$ 43$.
c. The charge for an appendectomy in Chile is $\$ 5509$. The countries in which an appendectomy costs more than in Chile are Canada, Switzerland, and United States.
9. a. We begin with the number of marriages between an African-American husband and a white wife in 2010. Look at the bars labeled with the year 2010. The yellow bar to the right represents the number of marriages between an African-American husband and a white wife. The number above this bar is 390, representing 390 thousand. Thus, in 2010, there were 390,000 marriages between an African-American husband and a white wife.
b. Look for the red bar labeled 61 (for 61 thousand, or 61,000 ). This is the bar to the left for the year labeled 1990 . Thus, in 1990, there were 61,000 marriages between a white husband and an African-American wife.

$$
9 x-3=42
$$

$9(6)-3=42$
$54-3=42$

$$

$A=(10)(3)$
$A=30$
The area of the rectangle is 30 square inches.
7. a. Because 2010 is 10 years after 2000, we substitute 10 for $x$ in the given formula. Then we use the order of operations to find $T$, the average cost of tuition and fees for the school year ending in 2010.
$T=6 x^{2}+319 x+3234$
$T=6(10)^{2}+319(10)+3234$
$T=6(100)+319(10)+3234$
$T=600+3190+3234$
$T=7024$
The formula indicates that for the school year ending in 2014, the average cost of tuition and fees at public U.S. colleges was $\$ 7024$.
b. The actual cost shown in the figure is $\$ 7020$.

Using subtraction: $7024-7020=4$, the mathematical model overestimates the actual cost by $\$ 4$.
