Chapter 2

- 1. How many neutrons and protons are there in the nuclei of the following atoms:
 - (a) ⁷Li, (b) ²⁴Mg,
 - (c) 135 Xe,
 - (d) 209Bi,
 - (e) 222Rn?

3. How many atoms are there in 10 g of ¹²C?

 $0.6022 \times 10^{24} = 0.502 \times 10^{24}$ atoms.

5. When H₂ gas is formed from naturally occurring hydrogen, what percentages of the molecules have molecular weights of approximately 2, 3, and 4?

The molecular in question are 'H'H, 'H3H or 3H'H, and 2H2H. Let 8(1) and 8(2) to the factions of naturally-occurring hydrogen that are 'H and 3H. Combining atoms fulled successively from a large volume of hydrogen, The fraction that have weight 2 is 8(1) × 8(1) = (0.99985)² = 0.9991 = 99.91%. The fraction with weight 4 is 8(2)×8(2) = 2.25×10-8 = 2.25×10-60/0. Weight 3 can be formed in two ways. The fraction of 3 is 8(1)×1(2) + 8(2)×1(1) = 2×1(1)×1(2) = 2×0.99985×0.00015 = 3.00×10-4 = 0.03 %. Note that the fraction that have molecular weights of either 2, 3, or 4 is 82(1)+28(1)×1/2) +82(2) = (811)+81(2))² = 1.

- 7. A beaker contains 50 g of ordinary (i.e., naturally occurring) water.
 - (a) How many moles of water are present?
 - (b) How many hydrogen atoms?
 - (c) How many deuterium atoms?

(a) Number of moles = 50/18.015 = 2.775. (b) No. of molecules = $2.775N_A = 1.67/\times10^{24}$. There are 2 atoms 3 H fer molecule, so no. of atoms of $H = 2\times1.67/\times10^{24} = 3.342\times10^{24}$. (c) No. of ²H atoms = $1.5\times10^{-4}\times3.342\times10^{24} = 5.013\times10^{20}$.

9. Compute the mass of a proton in amu.

Man of proton = 1.67265 x/0 2/k 1 amu = 1.66057 x/0 2/kg, mass of porton in amu in

Mp (amu) = 1.67265×10-27 Kg / 1.6605 7 × 10-27 Kg/amg

= 1.0073 amu

.11. Show that 1 amu is numerically equal to the reciprocal of Avogadro's number.

Avagodor's number iv ,6022 × 1024

- 166057 × 10-27 K

13. Using Eq. (2.3), estimate the density of nuclear matter in g/cm³; in Kg/m³. Take the mass of each nucleon to be approximately 1.5×10^{-24} g.

The volume of the nucleus is
$$V = \frac{4}{3} \pi R^3 = \frac{4}{3} \pi (1.25 \times 10^{-13})^3 A.$$
The nucleon density is then
$$\frac{A}{V} = \frac{3 \times 10^{39}}{4 \pi (1.25)^3} \text{ nucleons} / \text{cm}^3,$$

and the mass density is
$$\int = \frac{3 \times 10^{39}}{4 \pi (1.25)^3} \times 1.6 \times 10^{-24} = 1.96 \times 10^{14} g/cm^3 \\
= 1.96 \times 10^{11} 4.5/m^3$$

15. The complete combustion of 1 kg of bituminous coal releases about 3×10^7 J in heat energy. The conversion of 1 g of mass into energy is equivalent to the burning of how much coal?

I gram is equivolent to $1 \times (3 \times 10^{10})^2 =$ $9 \times 10^{20} \text{ ergs} = 9 \times 10^{13} \text{ joules}$. From Table I.8, $1 = 9.418 \times 10^{-4} \text{ Btu}$. Thus $19 \sim 9 \times 10^{13} \times 9.478 \times 10^{-4} = 8.530 \times 10^{10} \text{ Btu}$. This is the heat relaxed from $8.530 \times 10^{10}/13000 \times 2000 = 3280 \text{ tons of Cool}$.

17. Compute the neutron-proton mass difference in MeV.

Using values from Table II.1, DM=Mn-Mp = 1.008665 - 1.007217 = 0.001388 annu. Since Iamu = 931.481 MeV, DM = 0.001388 x 931.481 = 1.293 MeV. 19. Derive Eq. (2.18). [Hint: Square both sides of Eq. (2.5) and solve for mv.]

From Eq. (2.5),

$$M = \frac{m_0}{\sqrt{1 - v^2/c^2}}$$

$$m^2 = \frac{m_0^2}{1 - v^2/c^2}$$

 $m^2c^4 - m^2v^2c^2 = m_0^2c^4$. But $mc^2 = E_{tot}$, $m_0c^2 = E_{pest}$, and $mv = \beta$. Thue, $\int_0^2 dt = \int_0^2 dt$

21. Using the result derived in Problem 2.20, calculate the speed of a 1-MeV electron, one with a kinetic energy of 1 MeV.

For an electron, $E_{post} = 0.511 \text{ MeV}$, and if its linetic energy is 1 MeV, then $E_{fot} = 1.511 \text{ MeV}$.

From prob. 2.16, $V = C \sqrt{1 - \left(\frac{0.511}{1.511}\right)^2} = 0.941C = 2.82 \times 10^{10} \text{ cm/poc.}$ $= 2.82 \times 10^8 \text{ m/cm}$

23. Show that the wavelength of a relativistic particle is given by

$$\lambda = \lambda_C \frac{m_e c^2}{\sqrt{E_{\text{total}}^2 - E_{\text{rest}}^2}},$$

where $\lambda_C = h/m_e c = 2.426 \times 10^{-10}$ cm is called the Compton wavelength.

From Eq. (2.19),
$$\lambda = \frac{kc}{\sqrt{E_{tot}^2 - E_{post}^2}} = \frac{k}{m_e c} \frac{m_e c^2}{\sqrt{E_{tot}^2 - E_{post}^2}}$$

$$= \lambda c \frac{m_e c^2}{\sqrt{E_{tot}^2 - E_{post}^2}}$$

- 25. An electron moves with a kinetic energy equal to its rest-mass energy. Calculate the electron's
 - (a) total energy in units of $m_e c^2$;
 - (b) mass in units of me;
 - (c) speed in units of c;
 - (d) wavelength in units of the Compton wavelength.

(a)
$$E_{tot} = 2mec^2$$
. (b) $mc^2 = E_{tot} = 2mec^2$, and $m = 2me$. (c) From froh. 2.16, $v = c\sqrt{1 - \left(\frac{mec^2}{2mec^2}\right)^2} = 0.866c$.

(d) From froh. 2.19, $\lambda = \lambda c \sqrt{\left(2m_ec^2\right)^2 - \left(m_ec^2\right)^2} = 0.577 \, \lambda c$

27. The first three excited states of the nucleus of ¹⁹⁹Hg are at 0.158 MeV, 0.208 MeV, and 0.403 MeV above the ground state. If all transitions between these states and ground occurred, what energy γ-rays would be observed?

$$\delta_1 = 0.158 M_2 V$$

 $\delta_2 = 0.05 M_2 V$
 $\delta_3 = 0.195 M_2 V$
 $\delta_4 = 0.208 M_2 V$
 $\delta_5 = 0.245 M_2 V$
 $\delta_6 = 0.403 M_2 V$

- 29. Tritium (³H) decays by negative beta decay with a half-life of 12.26 years. The atomic weight of ³H is 3.016.
 - (a) To what nucleus does ³H decay?
 - (b) What is the mass in grams of 1 mCi of tritium?

(a) Tritue 3H wrints of a poston and two newtrom. Beta decay results in transformation of a newtra a proton plus an electron. The product has a proton of proton and I newtron and in their are isotops of helice

3H -> 3He + B-

(b) Activity, &, in In. For Inti, the decay constant is in

d= 10-3Ci x 3.7x10"dis/szc = 3.7x10"dis/sc

M = \frac{\pi}{\pi}

3/4 \frac{\pi}{\pi}

.6022×1024 tom/
g-at

31. Carbon tetrachloride labeled with ¹⁴C is sold commercially with an activity of 10 millicuries per millimole (10 mCi/mM). What fraction of the carbon atoms is ¹⁴C?

Carbon totractored in CCIq There irone atom of carbon per molecule. In I m H there are I m H of carbon shows or .6022×10²⁴ dom/mol × 10⁻³ mole for H = .6022×10²¹ alone C/mH. If the Saugh contains 10 m Ci I han there are 3.7×10'dis/seex 10 3c/m Ce or 3.7×10⁷ dis/see due to 'C. The actually of = 2 N. 12 0.693/Tyz. T/z = 573Cyx 3C5 d × 24hmx 3Coope 1.805×10's A = 3.83×10⁻¹² sec⁻¹, N= d 3.7×10⁷ = 9.66×10's alone 16 fradom of alon that is carbon 17 is 1 mH is then 9.66×10¹⁸/, 6022×10²¹ = 1.6×10² or 1.6%.

33. After the initial cleanup effort at Three Mile Island, approximately 400,000 gallons of radioactive water remained in the basement of the containment building of the Three Mile Island Unit 2 nuclear plant. The principal sources of this radioactivity were 137 Cs at 156 μ Ci/cm³ and 134 Cs at 26 μ Ci/cm³. How many atoms per cm³ of these radionuclides were in the water at that time?

$$\frac{d(^{137}Cs)}{30,29n} = 156\mu C:/cm^3 \text{ and } t_{12}^{137} = 30,29n$$

$$\lambda_{137} = \frac{\ln 2}{t_{12}^{137}} = \frac{\ln 2}{30,29n} = 0.02309n^{-1}$$

$$\frac{d(^{134}Cs)}{2} = 26\mu C:/cm^3 \text{ and } t_{12}^{134} = 2.069n,$$

$$\lambda_{134} = \frac{\ln 2}{t_{12}^{134}} = \frac{\ln 2}{2.069n} = 0.33659n^{-1}$$

$$\frac{d_{137}}{d_{137}} = \frac{\lambda_{137}}{d_{137}} = \frac{(156 \times 10^{-6}C:/cm^3)(3.7\times 10^{10}d:s/sec-C:)}{(0.02309n^{-1})} \times \frac{(\frac{3.15}{139} \times 10^{15}sec)}{(0.02309n^{-1})} \times \frac{(\frac{3.15}{139} \times 10^{15}sec)}{(0.33659n^{-1})} \times \frac{($$

= 9,01 × 10 13 toms/am 3

35. Polonium-210 decays to the ground state of ²⁰⁶Pb by the emission of a 5.305-MeV α-particle with a half-life of 138 days. What mass of ²¹⁰Po is required to produce 1 MW of thermal energy from its radioactive decay?

MW of thermal energy from its radioactive decay?

$$216P_0 \longrightarrow Pb + d$$

$$2(2^{10}P_0) = 4 \text{ of } d. \text{ sint } / \text{sec}$$

$$E = \text{lineary released } / \text{disint} = 5,305 \text{ MeV}$$

$$Pown = dE = P$$

$$d = \lambda_{210} M_{210}$$

$$M_{210} = \frac{P}{\lambda_{210}} E$$

$$\lambda_{210} = \frac{en2}{t_{1/2}^{210}} = \frac{en2}{138da} \left(\frac{10a}{24ma}\right) \left(\frac{hr}{3600sec}\right)$$

$$= 5,81 \times 10^{-8} \text{sec}^{-1}$$

$$M^{10} = \frac{1110}{(5,81 \times 10^{-8} \text{sec}^{-1})} (5.305 \text{ MeV}) \times (106 \text{ meV})$$

$$= (2.03 \times 10^{25} \text{ atoms}) (2105 / \text{mole})$$

$$= (2.03 \times 10^{25} \text{ atoms}) \text{ mole}$$

$$= 7.08 \times 10^{3} 5 = 7.08 \times 5$$

37. Since the half-life of 235 U (7.13 × 10⁸ years) is less than that of 238 U (4.51 × 10⁹ years), the isotopic abundance of 235 U has been steadily decreasing since the earth was formed about 4.5 billion years ago. How long ago was the isotopic abundance of 235 U equal to 3.0 a/o, the enrichment of the uranium used in many nuclear power plants?

$$t_{1/2}^{235} = 7.13 \times 10^{9} \text{ gra}$$

$$\lambda^{135} = \ln 2/t_{1/2}^{235} = 9.72 \times 10^{9} \text{ gr}$$

$$t_{1/2}^{238} = 45/ \times 10^{9} \text{ gra}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{238} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{235} = \ln 2/t_{1/2}^{235} = 1.54 \times 10^{9} \text{ gr}$$

$$\lambda^{2$$

Dividing the 2 decay equation yields
$$\frac{\pi^{235}(t)}{\pi^{235}(t)} = \frac{\pi_0^{235}}{\eta_0^{235}} (3^{257})_{t}^{235})_{t}$$
Solve for t

$$t = \frac{1}{1^{237} 3^{235}} \ln \left(\frac{\pi^{235}}{\pi_0^{257}} / \pi_0^{257} \right)$$

$$t = \frac{1}{154 \times 10^{-10} \eta^{-1} - 9.72 \times 10^{-10} \eta^{-1}} \ln \left(\frac{0.00725}{0.03093} \right)$$

$$t = 1.77 \times 10^{9} \eta \mu$$

39. Consider the chain decay

$$A \rightarrow B \rightarrow C \rightarrow$$

with no atoms of B present at t = 0.

(a) Show that the activity of B rises to a maximum value at the time t_m given by

$$t_m = \frac{1}{\lambda_B - \lambda_A} \ln \left(\frac{\lambda_B}{\lambda_A} \right),$$

at which time the activities of A and B are equal.

(b) Show that, for $t < t_m$, the activity of B is less than that of A, whereas the reverse is the case for $t > t_m$:

(or mainimum) when dots =0. Taking the derivative wiret, time of de given: $\frac{dd_B}{dt} = \frac{\alpha_{A0}\lambda_B}{\lambda_{0}-\lambda_{0}} \left(-\lambda_{A}e^{-\lambda_{A}t} + \lambda_{B}e^{-\lambda_{B}t}\right) = 0$ $e^{-(a-\lambda_B)t} = \frac{\lambda_B}{2}$ taky but of both sides and solve for tom given $t_m = \frac{1}{\gamma_p - \lambda_p} \left(\ln \frac{\lambda_p}{\lambda_A} \right)$ b.) For tetim, does har to be 70 soice at

tetim dos - 0 ed do wa maximim. For ddo >0 then for ddB >0 need at >0 Since dB = ABB But dns = - ABB + AABA Thun dB > dB. For ddB <0 rever is true

41. Show that the abundance of ²³⁴U can be explained by assuming that this isotope originates solely from the decay of ²³⁸U.

U and 234 U are nuclider in the Uranuin Serier. The notoper in the first portion of the series are 238 U, 274 Th, 274m Pa, 234 Pa, and 277 U. The half-left of 278 U in 4.51 × 109 yrs The half-live of the other isotopes are much shorter than 27 U then, the decay constants of the other membrands much less than the decay constants of the other membrands much less than the decay constants of the other membrands much less than the decay constants of the other membrands much less than the decay constants of 238 U are in secule equilibries and all decay at the rate set by 238 U. One can show that

or

$$\frac{\lambda_{238}}{\lambda_{239}} = \frac{N_{239}}{N_{278}}$$

Since T1/2 234 = 2.48 × 10 5 yrs

From Appendix II table II. 2 the abundance of 22 1/4 in 0.0055 alo and of 23 1 99.27 a/0 the natur is then 5.5 × 10⁻⁵. Then 23 1 can be assumed to originate from the decay of 23 1.

43. According to U.S. Nuclear Regulatory Commission regulations, the maximum permissible concentration of radon-222 in air in equilibrium with its short-lived daughters is 3 pCi/liter for nonoccupational exposure. This corresponds to how many atoms of radon-222 per cm3?

An advits of 3pcillites = 3×10-12Cilletes. From the definition of C: = 3.7×10 dis/sec then the concentration of 3 p Ci/liter yilds 11.1 × 10 dis/secof 1.11 dis/sec-liter. This is the 227 Rn activity is a liter. But the activity in hen Nen them the number of atom in a leter that yould Illdir/sec

NRn= Ill diskee

From the chart of the muchda, Ty = 3.8 dg cal there 7 = 2,11×10 sec- The meber of atom is 5,26×105

^{45.} Complete the following reactions and calculate their Q values. [Note: The atomic weight of ¹⁴C is 14.003242.]

49. The atomic weight of ²⁰⁶Pb is 205.9745. Using the data in Problem 2.35, calculate the atomic weight of ²¹⁰Po. [Caution: See Problem 2.46]

51. Consider the reaction

Using atomic mass data, compute:

(a) the total binding energy of ⁶Li, ⁹Be, and ⁴He;

(b) the Q value of the reaction using the results of part (a).

$$BE = [2 \ M('H) + NM_{N} - Matom)] S31 MeV/emn$$
 $M('H) = 1.002825$
 $M_{Li} = 5.012537$
 $M_{He} = 4.002604$
 $M_{N} = 1.06866$
 $M_{Be} = 9.012186$

Evaluating for each
 $BE_{Li} = 31.993$
 $BE_{Be} = 58.163$
 $BE_{He} = 28.296$
 $Q = BE_{Be} - (BE_{Li} + BE_{E})$
 $= -2.176 MeV$

53. Using the mass formula, compute the binding energy per nucleon for the nuclei in Problem 2.52. Compare the results with those obtained in that problem.

57. Calculate the atom density of graphite having density of 1.60 g/cm³.

59. What is the atom density of 235 U in uranium enriched to 2.5 a/o in this isotope if the physical density of the uranium is 19.0 g/cm³?

- 61. It has been proposed to use uranium carbide (UC) for the initial fuel in certain types of breeder reactors, with the uranium enriched to 25 w/o. The density of UC is 13.6 g/cm^3 .
 - (a) What is the atomic weight of the uranium?
 - (b) What is the atom density of the 235U?

Weight of Unanci in each cc is then

$$g_u = \omega/o \text{ Unanci } \approx Suc$$
 $= 12.85 \text{ S/cc}$
 $= 12.85 \text{ S/cc}$
 $= 40 \text{ Turner} = \frac{\omega/o_u S_u}{100 \text{ Mars}} = \frac{25 \times 12.95 \times .6022 \times 10^{24}}{100 \times 235,0439}$
 $= 1.89 \times 10^{23} \text{ utoms/cc}$

63. The fuel for a certain breeder reactor consists of pellets composed of mixed oxides, UO_2 and PuO_2 , with the PuO_2 comprising approximately 30 w/o of the mixture. The uranium is essentially all ²³⁸U, whereas the plutonium contains the following isotopes: ²³⁹Pu (70.5 w/o), ²⁴⁰Pu (21.3 w/o), ²⁴¹Pu (5.5 w/o), and ²⁴²Pu (2.7 w/o). Calculate the number of atoms of each isotope per gram of the fuel.

Pulz compain 30 w/o of the fuel or each gram of fuel contain is on of Pulz. The w/o of the notoper are 251 Pu = 705 w/o 740 Pu = 21.3 w/o, 241 Pu = 5.5 of a cel 242 Pu = 2.7 w/o. The meter density upon gram of fuel in the the respective w/o time the w/o that is Pu this 13
