Multiple Choice

- 1. Which of the following is a major difference between research in social psychology and research in other fields?
 - a. Social psychologists are less likely to rely on empirical observation to draw conclusions.
 - b. Many people have intuitive opinions about the questions that social psychologists study empirically.
 - c. Social psychology researchers are less concerned with theories and more concerned with data.
 - d. Social psychology is less of a science than many other fields.

ANSWER: b

- 2. "Moms prefer Brand X of peanut butter" is a commercial claim. Sarah wonders what other brands were used as the comparison group. Which of the following benefits of learning about research methods is Sarah displaying?
 - a. Better understanding of studies
 - b. Better memory for the results of studies
 - c. Critical evaluation of information
 - d Enhanced self-esteem

ANSWER: c

- 3. Why do social psychologists use the scientific method when studying human behavior?
 - a. To encourage the use of basic research rather than applied research
 - b. To replicate their findings
 - c. To ensure that the right people get credit for the research.
 - d. To provide a solid theoretical foundation for social psychological research.

ANSWER: b

- 4. Adarah is learning about research methods in her social psychology course. She should experience all of the following benefits *except* that
 - a. she will develop a better appreciation for the advantages of anecdotal stories.
 - b. the findings she learns about in class will be easier to understand and remember.
 - c. she will become a more sophisticated consumer of information in general.
 - d. it will improve her reasoning about real-life events.

ANSWER: a

- 5. What is integral to starting social psychological research?
 - a. Control group
 - b. Subject variable
 - c. Question
 - d. Independent variable

- 6. Which of the following statements concerning research questions in social psychology is FALSE?
 - a. Social psychologists sometimes develop research questions based on their own personal experiences and observations.

Name:	Class:	Date:
Chapter 02-Doing Social Psycholog	y Research	
b. Research questions can be inspired by rec. Research questions are often determinedd. Social psychologists can develop research ANSWER: c	after the research begins rather	than before it starts.
7. Why do social psychologists use electronic da. To determine the moral value of their results b. To find published research on a particula c. To increase the external validity of their d. To help them select a random sample of ANSWER: b	search question ar topic research	
8. Which of the following resources is a research psychology? a. GooglePsych b. TrackPsych c. PsychFind d. PsycINFO ANSWER: d	th database that provides specific	c information related to the field of
 9. A hypothesis provides a means of a the a. testing b. creating c. proving d. generalizing ANSWER: a	ory.	
10. Which of the following is NOT a testable has a. People smile more when they are lying to b. Refusing to help someone in need is more. Stereotypes are more likely to impact jude. Women tend to have more opposite-sex ANSWER: b	han when they are telling the trurally wrong. dgments when people are tired.	ıth.
11. Hypotheses must be all of the following <i>exc</i>a. comprehensive.b. explicit.c. testable.d. predictive. ANSWER: a	cept	

Name:	Class:	Date:
-------	--------	-------

- 12. What is the definition of hypothesis?
 - a. An investigation about how a testable prediction is carried out
 - b. An organized set of principles used to explain observed phenomena
 - c. The specific procedure through which a set of questions is tested
 - d. An explicit, testable prediction about the conditions under which an event will occur

ANSWER: d

- 13. An organized set of principles used to explain observed phenomena is called a(n)
 - a. personal bias.
 - b. theory.
 - c. hypothesis.
 - d. educated guess.

ANSWER: b

- 14. Theories in social psychology have all of the following characteristics except that
 - a. they are efficient and precise.
 - b. they lead to new hypotheses.
 - c. they predict conditions under which events will occur.
 - d. they encompass all of the relevant information.

ANSWER: c

- 15. Britney believes that exposure to violent television increases aggressive behavior by making people's own aggressive thoughts more accessible. Christina believes that violent television increases aggressive behavior by impairing people's cognitive abilities, which in turn makes them worry less about the consequences of their behavior as well as more likely to have aggressive thoughts. If we knew that violent television indeed increases aggressive behavior but knew nothing else on this topic, which of the following two theories should we prefer?
 - a. Christina's, because it is more empirical than Britney's
 - b. Britney's, because it is more efficient than Christina's
 - c. Christina's, because it is more testable than Britney's
 - d. Britney's, because it is more testable than Christina's

ANSWER: b

- 16. Which of the following is NOT involved in basic research?
 - a. Solving practical or real-world problems
 - b. Increasing our understanding of human behavior
 - c. Testing hypotheses
 - d. Increasing our understanding of animal behavior

ANSWER: a

- 17. Melissa's research examines the cognitive processes involved in persuasion and how those processes can be used to persuade women to have yearly mammograms. This work represents an integration of
 - a, basic and applied research.

Name:	Class:	Date:
Chapter 02-Doing Social Psycho	ology Research	
b. independent and dependent research	n.	
c. hypothetical and theoretical researc	h.	
d. experimental and nonexperimental	research.	
ANSWER: a		
18. Which of the following BEST describe a. To solve practical problems	es the primary goal of basic research?	
b. To integrate the different research r	nethodologies within one subfield of so	ocial psychology
c. To test specific hypotheses derived	from a specific theory	
d. To make real-time applications		
ANSWER: c		
19. In encouraging social psychologists to a. set apart reliability issues from valid	_	rt Lewin
b. urged the synthesis of basic and app	blied research.	
c. emphasized the importance of expe	rimental methodologies.	
d. reduced the distinction between hyp	potheses and theories.	
ANSWER: b		
20. Dr. Pinsker is conducting research that (science, technology, engineering, and mat a. applied		
b. integration of basic and applied		
c. basic		
d. descriptive		
ANSWER: a		
21. Which of the following is NOT true of		?

- - a. It is often conducted by researchers who also conduct basic research.
 - b. It contributes to solutions of social problems.
 - c. It was pioneered by Kurt Lewin.
 - d. It is more experimental than basic research.

ANSWER: d

- 22. Sapna is interested in the influence of nutrition on reaction time. She assigns participants to eat a salad and fruit for dinner every day for a week or to eat fast food each day. She then brings participants into the lab and asks them to push a button on a keyboard as fast as they can every time they hear a particular sound. What are the operational definitions of the variables in Sapna's study?
 - a. nutrition; reaction time
 - b. nutrition; whether participants eat a salad or fast food
 - c. whether participants eat salad or fast food; how quickly they push the button when they hear the sound
 - d. whether participants eat salad or fast food; reaction time

Name:	Class:	Date:
-------	--------	-------

ANSWER: c

- 23. Construct validity is BEST defined as the extent to which
 - a. participants who are tested repeatedly on the same measure will yield the same results.
 - b. the participants in a study were subjected to both random assignment and random selection.
 - c. results in a study can be achieved upon repeated administration of the same measuring instrument.
 - d. measures used in a study really measure the conceptual variables they were designed to measure.

ANSWER: d

- 24. Which of the following statements about construct validity does NOT hold?
 - a. It ensures that the study is high in internal validity.
 - b. It is relevant to both the dependent and independent variables in a study.
 - c. It can be identical for two researchers who have different operational definitions of the same conceptual variable.
 - d. It facilitates the testing of both hypotheses and theories.

ANSWER: a

- 25. In a study concerning the cues that signal deception, Winston uses the number of times a person shifts in his or her seat as a measure of lying. Virginia points out that people may shift their position because they are nervous about being perceived as a liar, even though they are actually telling the truth. Virginia is questioning the _____ of Winston's measure of lying.
 - a. internal validity
 - b. construct validity
 - c. interrater reliability
 - d. mundane realism

ANSWER: b

- 26. Which of the following is NOT relevant to self-reports?
 - a. They are sometimes inaccurate because people intentionally present themselves in a socially desirable way.
 - b. They may not allow for individuals to explicitly remember the thoughts or behaviors they are asked about.
 - c. They allow researchers access to individuals' private thoughts and feelings.
 - d. They are not influenced by the phrasing of a question or the response options provided.

ANSWER: d

- 27. Your book describes a study in which participants were provided with information about either the success rate or failure rate of condoms. The findings of this study indicate that
 - a. the simple wording of a question can have a drastic effect on self-report responses.
 - b, men and women had very different opinions about the effectiveness of condoms.
 - c. participants often lie when they are asked about sensitive personal issues.
 - d, college students tend to be naively ignorant of the risks associated with unsafe sex.

ANSWER: a

Name:	Class:	Date:
Chapter 02-Doing Social Psychology	ogy Research	
28. Which of the following procedures is use a. Experimental research	ed to increase the accuracy of self-rep	ports?
b. Construct validity		
c. The bogus pipeline technique		
d. Random sampling		
ANSWER: c		
29. When interrogating a woman in a string of am asking you these questions and I'd advise to answer them again when attached to a lie-of a. bogus pipeline	you to answer honestly. When we as	re done chatting, you are going to have
b. experimental realism		
c. deception		
d. quasi-experimental		
ANSWER: a		
30. Researchers have developed interval-con a. reduce memory distortions in self-rep		-contingent report methods to
b. amplify memory distortions in self-re	port measures.	
c. increase the role of values in the resea	arch process.	
d. observe participants' behavior unobtr	usively.	
ANSWER: a		
31. Johanna is participating in a study on soci is supposed to record in a journal the number minutes. The researcher is using self-re	of social interactions she had that da	
a. event-contingent		
b. signal-contingent		
c. bogus pipeline		
d. interval-contingent		
ANSWER: d		
32. Johanna is participating in a study on socreceives a text message to which she respond The researcher is using self-report in that a. signal-contingent	s with information about who she wa	
b. interval-contingent		
c. bogus pipeline		
d. event-contingent		
ANSWER: a		

33. Rhianna is participating in a study on social contacts and subjective well-being. After each social interaction that is

Name:	Class:	Date:
Chapter 02-Doing Social Psycholo	ogy Research	
onger than 5 minutes in duration, Rhianna log The researcher is using self-report in this a. signal-based	•	questions about how she is feeling.
b. event-based		
c. interval-based		
d. bogus pipeline		
ANSWER: b		
34. Self-report measures and observational me		
a. are subject to profound distortions from	•	
b. require exceptionally high interrater re	•	
c. may be biased by participants presenting		
d. provide direct access to people's thoug	thts and feelings.	
ANSWER: c		
35. To assess the extent to which students are are. What technique does this professor apply a. An event-contingent self-report	-	tes how creased the spines of books
b. An observational measure		
c. A descriptive study		
d. A signal-contingent self-report		
ANSWER: b		
36. Interrater reliability is BEST employed in a. The degree of correlation of students' r	0 1	
b. The relationship between the quality ra	atings and actual health in different nurs	sing homes
c. The degree of jury agreement in rating	children's paintings	
d. A comparison of toy preferences of too	ddlers at different intervals	
ANSWER: c		
37. What is the significant advantage of obser	rvational research?	
a. Seeking evidence to support ideas of di	ifferent observers	
b. Having control over events		
c. Avoiding faulty recollections and disto	orted interpretations of our own behavio	r
d. Eliminating the problems of the past		
ANSWER: c		

38. Which of the following is/are NOT mentioned in the text as a technology used by social psychologists in obtaining

b. Measures of reaction time and heart rate

a. Brain imaging technology

data?

Name:	Class:	Date:
Chapter 02-Doing Social Psyc	hology Research	
d. Eye tracking		
ANSWER: c		
39. The research methods used by social a. systematic	l psychologists tend to emphasize all of the	e following except a(n) approach.
b. objective		
c. variable		
d. quantifiable		
ANSWER: c		
40. What is the most popular method of a. Meta-analysis	testing ideas in social psychology?	
b. Descriptive research		
c. Correlational research		
d. Experimentation		
ANSWER: d		
11. Social psychologists use descriptive	research in order to describe	
a. associations between two or more		
b. people and their thoughts, feeling		
c. the strength of an observed effect		
	tween independent and dependent variable	es.
ANSWER: b	······································	
© 1	66	•
	s lower interest rates on home mortgages th	nan nonminorities?
ANSWER: d	to wer interest rates on nome mortgages as	
13. A study that examines existing recor	rds or databases is referred to as a(n)	
a. anecdotal study.	us of databases is referred to as a(ii)	
b. survey.		
c. case study.		
d. archival study.		
ANSWER: d		
14. To examine potential gender difference be personal ads placed by men and won	nces in the qualities individuals seek in the	eir romantic partners, HaeJin compares

a. experiment.

Name:	Class:	Date:
	' -	

- b. observational study.
- c. archival study.
- d. survey study.

ANSWER: c

- 45. Latrell, the editor of a popular sports magazine, would like to know more about the demographics of the magazine's readers. He designs a questionnaire to assess this information and sends it to a random sample of the magazine's readers. Latrell is conducting a(n)
 - a. survey.
 - b. observational study.
 - c. archival study.
 - d. experiment.

ANSWER: a

- 46. The MOST important aspect of sampling in a survey study is
 - a. its inclusion of equal numbers of individuals from different groups in the population.
 - b. the number of people in the sample.
 - c, the ratio of the sample size to the population size.
 - d. the total number of groups in the population.

ANSWER: c

- 47. A television producer is interested in whether women like soap operas more than sitcoms. The producer uses a random number table to select a sample of 100 households, and then makes phone calls to these households every afternoon for three weeks. Of those who were home when the producer called, 75% reported they liked soap operas more than sitcoms. Which of the following might raise questions about the results?
 - a. The use of archival data
 - b. The representativeness of the sample
 - c. The construct validity of the measure
 - d. The operational definition advanced by the magazine

ANSWER: b

- 48. Many social psychological questions can be addressed only with surveys because
 - a. funding sources are looking to save money and surveys are relatively inexpensive.
 - b. researchers rarely have time to carry out complex social psychological experiments.
 - c. the analysis of surveys permits much tighter control than could otherwise be achieved.
 - d, they involve variables that are impossible or unethical to observe directly or manipulate.

ANSWER: d

- 49. In principle, the purpose of random sampling is to make sure that research participants
 - a. have the right to withdraw from a study without incurring any penalty.
 - b. are fully informed as to the procedures and hypotheses of the study.
 - c. do not differ from one another in systematic ways.

Name:	Class:	Date:
Chapter 02-Doing Social Psyc	hology Research	
d. constitute a representative sample	e from the population of interest.	
ANSWER: d		
•	elational research methods differ from eack at relationships between variables.	ch other?
•	ful when one wants to infer causation.	
c. Correlational research cannot ma		
	researcher to control the participants' acti	ions.
ANSWER: a	1 1	
evel of empathy. He surveys a randomly	a relationship between the number of psyc y selected group of college students. Each and then completes an empathy scale. Luk	student indicates the number of
b. experiment.		
c. prospective study.		
d. archival study.		
ANSWER: a		
52. The main purpose of conducting cor		
•	between an independent and a dependent	variable.
b. describe the population's average	-	
c. manipulate one variable but hold		
	of the association between two measured	l variables.
ANSWER: d		
53. Which of the following statements co	oncerning correlational research is TRUE	?
a. In correlational research, variable	es are measured but not manipulated.	
b. In correlational research, one vari	iable is manipulated and one is measured.	
c. Correlational research can be con	ducted using observational, but not archiv	val, measures.
d. Correlational research can be con	ducted using archival, but not observation	nal, measures.
ANSWER: a		
54. The sign of a correlation coefficient a. quality	indicates the of the relationship betw	ween variables.
b. strength		
c. power		
d. direction		
ANSWER: d		

55. Which of the following correlation coefficients reflects the *strongest* meaningful relationship?

Name:	Class:	Date:
	·	

a. +0.67

b. 0.00

c. -0.86

d. +1.25

ANSWER: c

- 56. When decreases in one variable are accompanied by decreases in another variable, the variables are described as
 - a. negatively correlated.
 - b. positively correlated.
 - c. causally related.
 - d. prospectively related.

ANSWER: b

- 57. Vito finds a correlation of -0.35 between procrastination behaviors and academic achievement. Which of the following is an appropriate conclusion for Vito to draw?
 - a. Procrastination leads students to perform more poorly.
 - b. Poor academic performance causes more procrastination.
 - c. Elimination of procrastination behaviors will lead students to perform better.
 - d. As a student procrastinates more, her academic achievement decreases.

ANSWER: d

- 58. Carmella finds a correlation of +0.47 between self-esteem and academic achievement. Which of the following is the MOST appropriate interpretation of this correlation?
 - a. High self-esteem motivates students to achieve more academically.
 - b. Doing well academically increases students' self-esteem.
 - c. The higher students' self-esteem, the greater their academic achievement.
 - d. As self-esteem increases, academic achievement decreases.

ANSWER: c

- 59. Which of the following is an example of a negative correlation?
 - a. The more pets you own, the better your physical health tends to be.
 - b. The more money people make, the bigger their house tends to be.
 - c. The more alcohol you consume, the lower your GPA tends to be.
 - d. The more points a player scores, the more time they play in the next game.

- 60. Suppose the correlation between the number of times couples go to the movies and the number of times they go out to dinner is +0.79. Among the following conclusions, which one is NOT consistent with this computation?
 - a. The more often that couples go to the movies, the more often they go out to dinner.
 - b. The less often that couples go to the movies, the less often they go out to dinner.
 - c. There is a strong positive correlation between the number of times couples go to the movies and the number of times they go out to dinner.

Name:				Class:	Date:	

d. Because the correlation coefficient is less than 1.0, the association between these two variables is very weak and probably unreliable.

ANSWER: d

- 61. Alan conducted an analysis to examine the relationship between pollution and low life expectancy in a rural setting. He estimated the correlation ratio to be 0.089 for the age group of 25 to 85 years. What type of correlation would he have observed?
 - a. No correlation
 - b. Positive correlation
 - c. Negative correlation
 - d. Weak correlation

ANSWER: a

- 62. Camryn uses a survey to measure the association between students' grade point average and weekly consumption of alcohol. She finds that higher GPAs tend to be associated with lower levels of alcohol consumption (and vice versa). This study is best described as a(n)
 - a. experiment.
 - b. observational study.
 - c. concurrent study.
 - d. correlational study.

ANSWER: d

- 63. One of the many advantages of correlational research is that it
 - a. allows researchers to study variables that cannot be examined using an experiment.
 - b, allows the researcher to test for and determine the nature of causal relationships.
 - c. exhibits high internal validity.
 - d. tends to be statistically significant.

ANSWER: a

- 64. What is the major limitation of random assignment?
 - a. It may result in inconsistent estimates of possible correlations.
 - b. It cannot establish causality.
 - c. It cannot be implemented for experiments involving more complex calculations.
 - d. It may affect external validity under certain conditions.

ANSWER: d

- 65. Which of the following statements about correlational research is TRUE?
 - a. It is a powerful way to establish causal relationships between variables.
 - b. It allows a researcher to establish cause-and-effect relationships.
 - c. It permits researchers to determine whether one variable is predictive of another.
 - d. It is limited to the study of variables that can be measured in the laboratory.

Name:	Class:	Date:
-------	--------	-------

- 66. What is the primary disadvantage of correlation studies compared to experimental studies?
 - a. They are more labor-intensive.
 - b. They do not allow one to determine causality.
 - c. The results are more difficult to understand.
 - d. The choice of variables that can be studied is limited.

ANSWER: b

- 67. Causation cannot be inferred from correlational studies because
 - a. they are so low in external validity.
 - b. they do not involve the manipulation of variables.
 - c. they are always conducted outside of the research lab.
 - d. researchers have too much control over the variables.

ANSWER: b

- 68. Which of the following conditions does NOT hold for conducting an experiment in social psychology?
 - a. All participants are treated equally.
 - b. The researcher has control over experimental procedures.
 - c. Participants are assigned to different manipulations.
 - d. The experiment is limited to be performed in a tightly controlled laboratory environment.

ANSWER: d

- 69. In a well-designed experiment, all participants must
 - a, be treated in exactly the same manner except for the specific differences the experimenter wants to create.
 - b. not realize that they are involved in an experiment.
 - c. be influenced by experimenter expectancy effects.
 - d. be allowed to choose their own experimental conditions without interference or bias from the experimenter.

ANSWER: a

- 70. Buster runs an experiment in which she finds that participants placed in a good mood by a happy film clip are more likely to offer help to a fellow participant than participants who see a sad film clip. Bob suggests that perhaps this difference simply results from the fact that the participants in the happy film clip condition were more helpful people to begin with. What methodological aspect of a successful experiment can Buster point to in order to refute this criticism?
 - a. External validity
 - b. Random selection
 - c. Random assignment
 - d. Manipulation

- 71. Which of the following characteristics is MOST relevant to the condition that any differences one obtains after the experimental manipulation of a study have been produced only by that manipulation?
 - a. Control of subject variables

Name:	Class:	Date:
-------	--------	-------

- b. Random sampling
- c. Construct validity
- d. Control over experimental procedures

ANSWER: d

- 72. Random assignment, a defining feature of an experiment, means that participants
 - a, select the particular experimental manipulations they wish to experience.
 - b. are chosen randomly from the population of interest.
 - c. have an equal chance of being in any of the conditions.
 - d. are assigned to groups on the basis of their preexisting differences.

ANSWER: c

- 73. A researcher examined the effects of mood on aggression in an experiment. She decided to see how receiving an insult or a compliment affects aggression, and she measured aggression by having participants administer small shocks to another participant. The researcher found that participants in the insult condition were more aggressive than those in the compliment condition. One of her colleagues reads about this research and voices concern that people in the insult condition may have been more naturally aggressive than people in the compliment condition, causing the differences observed by the researcher. This concern about preexisting differences between participants in the two conditions would only be valid if participants were not
 - a. a representative sample of the population.
 - b. randomly assigned to the condition.
 - c. randomly selected from the population.
 - d. informed that they were involved in a correlational study.

ANSWER: b

- 74. Random assignment is essential to establishing causality because it
 - a. permits researchers to verify that they have a diverse and representative sample of participants.
 - b. reduces the possibility that individual characteristics of the participants produced the observed results.
 - c. increases the external validity of the experiment and virtually eliminates issues of reliability.
 - d. allows researchers to determine whether or not their operational definitions reflect the variables of interest.

ANSWER: b

- 75. The procedure used to ensure that research participants have an equal chance of being placed in the experimental or control groups in an experiment is called
 - a. random assignment.
 - b. random sampling.
 - c. debriefing.
 - d. experimental realism.

ANSWER: a

- 76. In comparison to field experiments, laboratory experiments
 - a. permit researchers greater control.

Name:	Class:	Date:
Chapter 02-Doing Social Psych	ology Research	
b. allow more naturalistic observation	n of behavior.	
c. are less susceptible to experimente	er expectancy effects.	
d. have fewer problems caused by the	e limitations of self-report data.	
ANSWER: a		
77. In an experiment, the independent var a. held constant; varied	riable is while the dependent variab	ble is
b. correlational; descriptive		
c. manipulated; measured		
d. general; specific		
ANSWER: c		
78. Which of the following characteristic a. They are neither dependent nor tru		
b. They cannot be manipulated or rar	ndomly assigned.	
c. They may include gender and ethn	icity of participants.	
d. They are essential for field experir	ments.	
ANSWER: d		
79. Stanley examines the impact of group en people stand on a city street and stare the window. This study is an example of a a. meta-analysis.	up at a window. He then records the nun	
b. archival study.		
c. experiment with one independent	variable	
d. experiment with two independent		
ANSWER: c	variables.	
ANSWER. C		
80. Professor Collison conducts an expering gressive behavior induces playing video a. Random		
b. Correlation		
c. Statistical		
d. Indirect		
ANSWER: b		

81. Vera thinks that having pets increases psychological functioning and well-being. To test this, individuals in one group of randomly selected nursing home residents are each given a pet while participants in a second group are not given pets. Over two months, the overall level of psychological functioning is evaluated on a daily basis. What is the independent

b. Whether or not the resident received a pet

variable in this study?

Name:	Class:	Date:
Chapter 02-Doing Social Psycho	ology Research	
c. The level of psychological function	ng demonstrated by the residents	
d. This is a correlational study, so there	·	
ANSWER: b	•	
82. Barb examines the impact that sitting in her study, the number of math questions an a. control		
b. conceptual		
c. independent		
d. dependent		
ANSWER: d		
83. Castilla wonders whether environmental brought into a room with either a rectangula starting deliberation. Castilla records how la. independent variable.	ar table or a round table. The jurors are	e asked to select a foreperson before
b. dependent variable.		
c. subject variable.		
d. control variable.		
ANSWER: a		
84. Robinson manipulates two variables in participants seated in the room and the room participants do better on the test when the ra. There are two independent variables	n temperature. He finds that regardless oom is less crowded. Which statement	s of the temperature in the room,
b. There is one independent variable in	ı this study.	
c. There are two dependent variables is	n this study.	
d. There are two dependent and two in	dependent variables in this study.	
ANSWER: a		
85. Natasha finds that men speak more ofte assigned to sit in the front of the room and for		· · · · · · · · · · · · · · · · · · ·
a. the independent variable she manipu	ılated.	
b. a subject variable.		
c. the conceptual variable.		
d, the experimental but not the correlat	tional variable.	

86. What does it mean to say that an experiment has two independent variables?

a. The researcher has created a study with two different conditions.

b. The researcher has come up with two different measures to take in order to test the hypothesis.

ANSWER: b

87. Leila runs an experiment to see the impact of mood on prosocial behavior. Participants are allowed to watch a video intended to put them in either a positive or neutral mood before they are asked to make a donation to a fictitious charity. What is the dependent variable in this study? a. The participants' mood b. Watching a happy or sad video c. The participants in the study d. Whether or not a donation is made to charity ANSWER: d 88. Rabiyah administered an intelligence test to sophomores and seniors at Faber College and at Hillman College and compared performance across these four groups. Which of the following is/are the subject variable(s) in this study? a. Being a sophomore versus a senior only b. Attending Faber versus Hillman College only c. Scoring high versus low on intelligence d. Both being a sophomore versus a senior and attending Faber versus Hillman College ANSWER: d 89. Achieving is typically more of a challenge in a field study than in a laboratory study. a. high external validity b. high internal validity c. high mundane realism d. cross-cultural reliability ANSWER: b 90. If the results of an experiment could have occurred by chance only five or fewer times in 100 possible outcomes, they are considered a. statistically significant. b. to have an interaction between the dependent variables. c. theoretically meaningful. d. null because of their low level of reliability.	Name:	Class:	Date:
d. The effects of one variable in the study have nothing to do with the effects of the other variable. ANSWER: c 87. Leila runs an experiment to see the impact of mood on prosocial behavior. Participants are allowed to watch a video intended to put them in either a positive or neutral mood before they are asked to make a donation to a fictitious charity. What is the dependent variable in this study? a. The participants' mood b. Watching a happy or sad video c. The participants in the study d. Whether or not a donation is made to charity ANSWER: d 88. Rabiyah administered an intelligence test to sophomores and seniors at Faber College and at Hillman College and compared performance across these four groups. Which of the following is/are the subject variable(s) in this study? a. Being a sophomore versus a senior only b. Attending Faber versus Hillman College only c. Scoring high versus low on intelligence d. Both being a sophomore versus a senior and attending Faber versus Hillman College ANSWER: d 89. Achieving is typically more of a challenge in a field study than in a laboratory study. a. high external validity b. high internal validity c. high mundane realism d. cross-cultural reliability ANSWER: b 90. If the results of an experiment could have occurred by chance only five or fewer times in 100 possible outcomes, they are considered a. statistically significant. b. to have an interaction between the dependent variables. c. theoretically meaningful. d. null because of their low level of reliability.	Chapter 02-Doing Social Psych	nology Research	
ANSWER: c 87. Leila runs an experiment to see the impact of mood on prosocial behavior. Participants are allowed to watch a video intended to put them in either a positive or neutral mood before they are asked to make a donation to a fictitious charity. What is the dependent variable in this study? a. The participants' mood b. Watching a happy or sad video c. The participants in the study d. Whether or not a donation is made to charity ANSWER: d 88. Rabiyah administered an intelligence test to sophomores and seniors at Faber College and at Hillman College and compared performance across these four groups. Which of the following is/are the subject variable(s) in this study? a. Being a sophomore versus a senior only b. Attending Faber versus Hillman College only c. Scoring high versus low on intelligence d. Both being a sophomore versus a senior and attending Faber versus Hillman College ANSWER: d 89. Achieving is typically more of a challenge in a field study than in a laboratory study. a. high external validity b. high internal validity c. high mundane realism d. cross-cultural reliability ANSWER: b 90. If the results of an experiment could have occurred by chance only five or fewer times in 100 possible outcomes, they are considered a. statistically significant. b. to have an interaction between the dependent variables. c. theoretically meaningful. d. null because of their low level of reliability.	c. The researcher is manipulating tw	o different variables in the course of the s	study.
87. Leila runs an experiment to see the impact of mood on prosocial behavior. Participants are allowed to watch a video intended to put them in either a positive or neutral mood before they are asked to make a donation to a fictitious charity. What is the dependent variable in this study? a. The participants' mood b. Watching a happy or sad video c. The participants in the study d. Whether or not a donation is made to charity ANSWER: d 88. confederate

d. Newcomb's (1961) study of interpersonal attraction in a highly structured dormitory setting

ANSWER: c

- 118. An individual's deliberate, voluntary decision to participate in research, based on the researcher's description of what will be required during such participation, is called
 - a. implied permission.
 - b. informed consent.
 - c. communicated assent.
 - d. referential validity.

ANSWER: b

- 119. Margarita is conducting research as part of her Master's thesis. She enlists the participation of undergraduate students in her laboratory, has them go through a series of activities, and then tells them what the true intent of the research was before they leave. She does not, however, inform them what their participation will involve before the research begins. Margarita has failed to remember the importance of
 - a. informed consent.
 - b. debriefing.
 - c. an institutional review board.
 - d. experimental realism.

ANSWER: a

- 120. The disclosure made to participants after research procedures are completed, in which the researcher explains the purpose of the research, is called
 - a. informed consent.
 - b. a post-hoc test.
 - c. experimenter expectancy effects.
 - d. debriefing.

ANSWER: d

- 121. Which of the following statements about social psychology/psychologists is TRUE?
 - a. Institutional review boards have had little effect on the types of research conducted by social psychologists.
 - b. Most social psychologists believe they have a moral imperative to study important topics even if doing so poses high risk for the study participants.
 - c. Social psychology research is devoid of human biases.
 - d. Strict adherence to scientific methods reduces but do not eliminate human biases in social psychology.

ANSWER: d

- 122. What event in 2011 has increased the level of discussion in social psychology about the role of values in the research process?
 - a. The mistreatment of experimental participants
 - b. The failure of IRBs to adequately oversee research

Name:	Class:	Date:
-------	--------	-------

- c. The confession of a researcher to fabrication of data
- d. The report that most researchers fail to debrief their participants

ANSWER: c

- 123. What is NOT a suggestion made in the text for how social psychology could protect itself against intentional or unintentional bias or dishonesty?
 - a. Using more precise and advanced statistical methods
 - b. Having researchers be more open to public scrutiny of their materials and data
 - c. Emphasizing the importance of replication of results
 - d. Having tenure and promotion less dependent upon publication of research

ANSWER: d

Essay

124. Compare and contrast random sampling and random assignment. Also, indicate how these procedures affect a study's internal and external validity.

ANSWER: A random sample indicates that all members of the target population have an equal chance of being selected for the study. Random samples are particularly attractive because they are more representative than other samples (such as convenience samples) of the populations from which they are taken. Moreover, because representative samples allow one to generalize the findings of a study to the larger population, random sampling increases external validity. Random assignment is a procedure that is only relevant when conducting an experiment; in this case, members of the sample (who have already been chosen, randomly or not) have an equal chance of being assigned to any of the experimental conditions. This procedure assures that, on average, members of experimental groups are equivalent in all ways before a study begins. This allows the researcher to infer that any differences between groups at the end of the study must be the result of the manipulation. In other words, it is random assignment that allows the researcher to conclude with confidence that the independent variable caused the changes in the dependent variable, which means that random assignment to condition increases internal validity.

125. What are the benefits and the main limitation of conducting correlational research over experiments? Give an example of negatively correlated variables. Justify your example.

ANSWER: An important advantage of doing correlational research rather than experiments is that correlational research can study associations of naturally occurring variables that cannot be manipulated or induced due to practical constraints, such as participants' gender, age, race, height, and so on. Correlational research can also examine phenomena that would be difficult or unethical to create for research purposes, such as certain kinds of violence, love, abuse of alcohol, and so on. Correlational research also offers more flexibility than experiments because a wide range of variables can be measured, including those obtained in the field, using archives, through national surveys, and so on. The primary disadvantage of doing correlational research rather than experiments is that a correlational study cannot demonstrate causation. That is, correlations cannot demonstrate cause-and-effect relationships between variables. A well-designed experiment, in contrast, can demonstrate that changes in one variable can cause a change in another variable. Two variables are negatively correlated if as one variable increases the other decreases (and vice versa). One pair of variables that should be negatively correlated with each other is the amount of time spent studying and the number of courses failed. As the amount of time one spends studying increases, the number of courses one fails should decrease.

126. What are the two essential characteristics of an experiment? Why, and how, is each of these important for the internal validity of the experiment?

Name:	Class:	Date:
-------	--------	-------

ANSWER: One essential characteristic of an experiment is that the researcher has control over the experimental procedures. The researcher manipulates the variables of interest and keeps all else uniform. That is, all participants should be treated exactly the same way—except for the manipulations that the experimenter is investigating. The other essential characteristic of an experiment is that all participants are assigned randomly to the different conditions. Because of random assignment to condition, at the beginning of the study there should be no systematic differences between the groups of participants. Internal validity is the degree to which there can be reasonable certainty that the independent variables in an experiment caused the effects obtained on the dependent variable. By having a great deal of control over the experimental procedures, researchers can help ensure that the only differences between conditions are the manipulations themselves and not some other factors. If other factors vary along with the independent variables, then it is less clear that the independent variables are the cause of any differences found in the dependent variable, thereby reducing the internal validity of the experiment. Even if the researcher has a great deal of control and ensures that the only differences in the treatment received by the participants across conditions are the manipulations of the independent variables, it is possible that the participants in one condition are different from the participants in other conditions in important ways just by random chance. If this is the case, the differences found in the dependent variable may be a function of these other differences rather than the result of the manipulations. If the participants are randomly assigned to the conditions, however, the chances that the participants differed in ways other than those created by the manipulations become very improbable, especially with larger samples. Differences found in the dependent variable can thus be attributed to the manipulations of the independent variables rather than to preexisting differences among the participants, thereby creating internal validity.

127. Imagine that some researchers are interested in college students' self-reports about their reactions to various stressful situations. Rather than simply asking the students to recall various stressful situations and their reactions to them, the researchers want to reduce the time between the students' self-reports about the situations and the actual situations themselves. Describe two methods that have been developed by social psychologists that could serve this purpose.

ANSWER: The textbook describes three such methods: interval-contingent, signal-contingent, and event-contingent. Using the interval-contingent method, the researchers would have the students report their experiences at regular intervals, such as once a day. Using the signal-contingent method, the researchers would ask the students to report their experiences as soon as possible after being signaled to do so, as with a beeper. Using the event-contingent method, the researchers would ask the students to report on a designated set of events as soon as possible after such events occurred; for example, the students might be asked to report their experiences as soon as possible after being confronted with a stressful situation.

128. What role do values play in the scientific process?

ANSWER: Values can influence what questions researchers even think of to ask, as well as the way in which they proceed to study that question. Some argue that because science is a human enterprise, values will influence the research process, and we should simply acknowledge this and proceed. Others see science as more value-free. They argue that it is better to try to rely heavily on the scientific method so as to avoid allowing one's personal biases and preconceptions to taint observations.

Values also influence the choices we make in any activity, research included. A value relevant to the

research process is honesty. It is important that researchers honestly report their findings so that the scientific process can iteratively build upon them. If researchers fabricate their results, as one Dutch social psychologist did recently, then science builds upon a story rather than an empirical observation. As a result, everyone loses.

129. Elaborately explain a correlation coefficient. How will you differentiate between a positive or a negative coefficient? ANSWER: When researchers examine the relationship between variables that vary in quantity (such as height or degree of self-esteem), they can measure the strength and direction of the relationship between the variables and calculate a statistic called a correlation coefficient. Correlation coefficients can range from -1.0 to +1.0. The absolute value of the number (the number itself, without the positive or negative sign) indicates how strongly

Name:	Class:	Date:
-------	--------	-------

the two variables are associated. The larger the absolute value of the number, the stronger the association between the two variables, and thus the better either of the variables is as a predictor of the other. Whether the coefficient is positive or negative indicates the direction of the relationship. A positive correlation coefficient indicates that as one variable increases, so does the other.

130. Describe the concepts of mundane realism and experimental realism, and relate them to the larger issue of external validity in a research study.

ANSWER: The external validity of an experiment may also depend in part on how realistic the study is for the participants. But what is meant by realistic is not as straightforward as one might think. Two types of realism can be distinguished: mundane versus experimental (Aronson & Carlsmith, 1968). Mundane realism refers to the extent to which the research setting resembles the real-world setting of interest.

In order to study interpersonal attraction, Theodore Newcomb (1961) set up an entire college dormitory—a striking example of mundane realism. Advocates of mundane realism contend that if research procedures are more realistic, research findings are more likely to reveal what really goes on. In contrast, experimental realism refers to the degree to which the experimental setting and procedures are real and involving to the participant, regardless of whether they resemble real life or not. According to those who favor experimental realism, if the experimental situation is compelling and real to the participants while they are participating in the study, their behavior in the lab—even if the lab is in the basement of the psychology building—will be as natural and spontaneous as their behavior in the real world. The majority of social psychologists who conduct experiments emphasize experimental realism.
