Chapter 2 Protein Composition and Structure

Matching Questions
Use the following to answer questions 1-10:

a) L-ami b) water c) protor d) Zwitte e) secon f) tertiar g) Rama h) cystei i) extrac j) histidi k) prolin l) Sange	no acids ns erions dary structure y structure uchandran ne ellular ne	ver from the list below. Not all of the answers will be used.
III) D-aII	iiio acius	
1.		Chiral type of amino acids found in proteins.
	Ans: a Section: 2.1	
2.		Another name for dipolar molecules.
	Ans: d Section: 2.1	
3.		Disulfide bonds are formed by pairs of which amino acid?
	Ans: h Section: 2.1	
4.		The amino acid with a pK_a near neutral pH.
	Ans: j Section: 2.1	
5.		When a peptide bond is formed, what molecule is also made?
	Ans: b Section: 2.2	

6.	Where are proteins with extensive disulfide links likely to be found?					
	Ans: i Section: 2.2					
7.	This amino acid residue frequently found in β-turns.					
	Ans: k Section: 2.1					
8.	Name of the plot that allows one to investigate the likely orientation of certain amino acid pairs.					
	Ans: g Section: 2.2					
9.	The type of structure to which α helices, β sheets, and turns are referred.					
	Ans: e Section: 2.3					
10.	The overall three-dimensional structure of a protein is referred to as					
	Ans: f Section: 2.4					
Fill-in	the-Blank Questions					
11.	The amino acid that contains a sulfur atom and is consider hydrophobic is					
	Ans: methionine Section: 2.1					
12.	Ans: A keratin Section: 2.3 is a fibrous protein and is the primary component of wool and hair.					
13.	Every third residue in the protein collagen is Ans: glycine Section: 2.3					
14.	Disulfide bonds in proteins can be reduced to free sulfhydryl groups by reagents such as					
	Ans: β mecaptoethanol Section: 2.6					
15.	A protein is considered to be when it is converted into a randomly coiled structure without its normal activity. Ans: denatured Section: 2.6					

16.	is the major fibrous protein present in skin, bone, tendon, cartilage,					
	and teeth.					
	Ans: Collagen Section: 2.3					
17.	Collagen contains, a modified amino acid.					
	Ans: hydroxyproline Section: 2.6					
18.	Agents such as and guanidine hydrochloride denature proteins by disrupting the noncovalent interactions. Ans: urea Section: 2.6					
19	refers to the spatial arrangement of subunits and the nature					
17.	of their interactions Ans: Quaternary structure Section: 2.5					
20.	The $_$ β -sheet structure occurs when the two strands are oriented in same directions (N \rightarrow C). Ans: antiparallel Section: 2.3					
Multip	ole-Choice Questions					
21.	Proteins function as					
	A) energy stores. D) None of the above. E) All of the above.					
	B) catalysts. E) All of the above. C) storage of genetic information. Ans: B Section: Introduction					
22.	Key properties of proteins include					
	A) a wide range of functional groups.					
	B) an ability to possess either rigid or flexible structures as dictated by functional requirements.					
	C) the ability to interact with other proteins.					
	D) a and b.					
	E) All of the above. Ans: E Section: Introduction					
	Table 2 Section Mediation					
23.	What charged group(s) are present in glycine at a pH of 7?					
	A) $-NH_3^+$ B) $-COO^-$ C) $-NH_2^+$ D) a and b E) a, b, and c Ans: D Section: 2.1					
24.	At a pH of 12, what charged group(s) are present in glycine?					
	A) $-NH_3+$ B) $-COO^-$ C) $-NH_2+$ D) a and b E) a, b, and c Ans: B Section: 2.1					

25.	 What do the amino acids tyr, asn and thr have in A) have aromatic rings B) are negatively charged at pH 7.0 	comn D) E)	contain double bonds in side chains				
	C) are positively charged at pH 7.0 Ans: E Section 2.1	L)	are polar				
26.	Which amino acids contain a sulfur atom? A) serine and methionine	D)	cysteine and methionine				
	B) serine and threonineC) methionine and threonineAns: D Section: 2.1	E)	cysteine and threonine				
27.	Name three amino acids that can be positively charged at a neutral pH.						
	A) lys, arg, and his	D)					
	B) his, arg, and cys C) cys, arg, and met Ans: A Section: 2.1	E)	arg, glu, and his				
	In the following peptide, which amino acid is the N-terminus?						
	Phe-Ala-Gly-Arg A) Ala B) Phe C) Phe and Arg D) Arg Ans: B Section: 2.2	E) No	one of the above.				
29.	What is the approximate mass of a protein containing 200 amino acids? (Assume there are no other protein modifications.) A) 20,000 B) 11,000 C) 22,000 D) 222,000 E) None of the above. Ans: C Section: 2.2						
30.	Which individual won a Nobel Prize for his landmark work in sequencing the protein insulin? A) Pauling B) McClintock C) Gilbert D) Maxam E) Sanger Ans: E Section: 2.2						
31.	 Why is the peptide bond planar? A) Bulky side chains prevent free rotation around the bond. B) It contains partial double-bond character, preventing rotation. C) Hydrogen bonding between the NH and C=O groups limits movement. 						
	D) None of the above.E) All of the above.Ans: B Section: 2.2						
32.	The configuration of most α-carbon atoms of amino acids linked in a peptide bond is A) cis. B) circular. C) parallel. D) trans. E) perpendicular. Ans: D Section: 2.2						
33.	What structure(s) did Pauling and Corey predict in 1951? A) α helix B) β sheet C) β turns D) a, b, and c E) a and b Ans: E Section: 2.4						

- 34. The term "quaternary" with respect to protein structure means
 - A) a repeating structure stabilized by intrachain hydrogen bonds.
 - B) the ability to form all four kinds of noncovalent bonds.
 - C) a multisubunit structure.
 - D) a linear sequence of four amino acids.
 - E) None of the above.

Ans: C Section: 2.5

- 35. Where are Ω and β turns and loops often found?
 - A) in a hydrophobic pocket

D) on the surface of proteins

B) on the interior cleft

E) None of the above.

C) at the protein interface with ligand

Ans: D Section: 2.3

- 36. What are some of the modifications that proteins acquire?
 - A) cleavage and trimming of the protein

D) a, b, and c

B) addition of carbohydrate groups

E) b and c

C) phosphorylation of certain groups

Ans: D Section: 2.6

37. Which of the following amino acid residues would most likely be buried in the interior of a water-soluble, globular protein?

A) Asp

D) Lys

B) Ser

E) Gln

C) Phe

Ans: C Section 2.5

Short-Answer Questions

38. How does a protein's amino acid sequence influence the tertiary structure?

Ans: A protein will spontaneously fold into a three-dimensional structure determined by the amino acid sequence.

Section: Introduction

39. What is the advantage of having 20 different amino acids available to form proteins?

Ans: The amino acids provide a rich diversity of functional groups, which can independently contribute to protein structure and function. In addition, many can be modified, increasing the diversity of functional groups.

Section: Introduction

40. What is the advantage of protein interaction and assembly with other proteins?

Ans: When proteins interact or assemble, new functions and specificity become available. Protein interactions allow new binding sites at the assembly interface, as well as providing multifunctional activity and specificity, such as found in polymerases and signal transduction.

Section: Introduction

41. What are the three aromatic amino acids?

Ans: phenylalanine, tyrosine, and tryptophan

Section: 2.1

42. Which amino acid side chains are capable of ionization?

Ans: The amino acids are: Asp, Glu, His, Cys, Tyr, Lys, and Arg.

Section: 2.1

43. How does the protein backbone add to structural stability?

Ans: The protein backbone contains the peptide bond, which has NH molecules and C=O (ketone) groups. Hydrogen-bond formation between the hydrogen on the nitrogen and the oxygen support the protein conformation.

Section: 2.2

44. Why are all the theoretical combinations of phi and psi not possible?

Ans: Steric hindrances of the side chains make certain combinations and angles impossible.

Section: 2.2

45. Describe some of the features of an α helix.

Ans: The α helix is coil stabilized by intrachain hydrogen bonds between the carbonyl oxygen of a residue and the amide hydrogen of the fourth residue away. There are 3.6 amino acids per turn. The hydrogen bonds are between amino acid residues that have two intervening residues. Thus, these amino acid residues are found on the same side of the coil. The helix is almost always right-handed, although left-handed helices are, in theory, possible.

Section: 2.3

46. What is the "hydrophobic effect" as it relates to protein structure?

Ans: The three-dimensional structure of a water-soluble protein is stabilized by the tendency of hydrophobic groups to assemble in the interior of the molecule.

Section: 2.1

47. A Keratin is referred to as a coiled-coil protein. Describe this protein structure.

Ans: Two or more α helices can entwine to form a very stable structure of approximately 100 nm.

Section: 2.3

48. What are prions?

Ans: Prions are proteins that can assume (after infection or by other causes) a new protein structure, which is self-propagating. The disease has several variants, and at least one is fatal to humans.

Section: 2.6

49. What does the modification involving the attachment of acetyl groups to the amino termini of a protein do?

Ans: The acetylation of the amino termini of proteins is to make these proteins more resistant to degradation.

Section: 2.6

50. In the ribonuclease experiments performed by Anfinson, what was the significance of the presence of the reducing agent β mercaptoethanol?

Ans: The reducing agent reduced incorrectly paired disulfide bonds, allowing them to reform with the correct pairing until the most stable conformation of the protein had been obtained.

Section: 2.6

51. What is the advantage of having certain regions of partially correct folded regions?

Ans: If some regions interact preferentially, lending stability to certain conformations as the protein folds, they can impact the overall structure of the protein.

Section: 2.6
