Preface

This solutions manual for Discrete-Time Control Systems, second edition, contains solutions to all B problems (unsolved problems in the text).

All the materials in the text may be covered in two quarters. In a semester course, the instructor will have some flexibility in choosing the subjects to be covered. If the student has an adequate background in the vector-matrix analysis, then by leaving approximately 10 percent of the text material to the student's self study, most of the important subjects of the text may be covered in one semester. In a quarter course, a good part of the first six chapters may be covered.

Katsuhiko Ogata

we have

$$\mathcal{Z}[k^3] = \frac{z^{-1}(1 + 4z^{-1} + z^{-2})}{(1 - z^{-1})^4}$$

B-2-3.

Method 1: Noting that

$$\mathcal{Z}[te^{-at}] = \frac{T e^{-aT} z^{-1}}{(1 - e^{-aT} z^{-1})^2}$$

we have

$$\begin{aligned} \mathcal{Z}[t^2 e^{-at}] &= \mathcal{Z}\left[-\frac{\partial}{\partial a} te^{-at}\right] = \frac{\partial}{\partial a} \left[\frac{-T e^{-aT} z^{-1}}{(1 - e^{-aT} z^{-1})^2} \right] \\ &= \frac{T^2 e^{-aT} (1 + e^{-aT} z^{-1}) z^{-1}}{(1 - e^{-aT} z^{-1})^3} \end{aligned}$$

Method 2:

$$\begin{aligned} \mathcal{Z}[t^2 e^{-at}] &= \sum_{k=0}^{\infty} (kT)^2 e^{-akT} z^{-k} \\ &= T^2 \left[(e^{aT} z)^{-1} + 4(e^{aT} z)^{-2} + 9(e^{aT} z)^{-3} + 16(e^{aT} z)^{-4} + \dots \right] \end{aligned}$$

Referring to Problem A-2-2, we have

$$\mathcal{Z}[t^2 e^{-at}] = \frac{T^2 e^{-aT} z^{-1} (1 + e^{-aT} z^{-1})}{(1 - e^{-aT} z^{-1})^3}$$

B-2-4.

$$\begin{aligned} \mathcal{Z}[x(k)] &= \mathcal{Z}[9k(2^{k-1})] - \mathcal{Z}[2^k] + \mathcal{Z}[3] \\ &= \frac{9z^{-1}}{(1 - 2z^{-1})^2} - \frac{1}{1 - 2z^{-1}} + \frac{3}{1 - z^{-1}} \\ &= \frac{2 + z^{-2}}{(1 - 2z^{-1})^2 (1 - z^{-1})} \end{aligned}$$

B-2-5. Referring to Problem A-2-4, we have

$$\mathcal{Z}\left[\sum_{h=0}^k a^h\right] = \frac{1}{1 - z^{-1}} X(z)$$

where

$$X(z) = \mathcal{Z}[a^h] = \frac{1}{1 - az^{-1}}$$

Hence

$$\mathcal{Z} \left[\sum_{h=0}^k a^h \right] = \frac{1}{1 - z^{-1}} \cdot \frac{1}{1 - az^{-1}}$$

B-2-6.

$$\begin{aligned} \mathcal{Z} [ka^{k-1}] &= \mathcal{Z} \left[\frac{\partial}{\partial a} a^k \right] = \frac{\partial}{\partial a} \mathcal{Z} [a^k] = \frac{\partial}{\partial a} \left(\frac{1}{1 - az^{-1}} \right) \\ &= \frac{z^{-1}}{(1 - az^{-1})^2} = \frac{z}{(z - a)^2} \end{aligned}$$

$$\begin{aligned} \mathcal{Z} [k(k-1)a^{k-2}] &= \mathcal{Z} \left[\frac{\partial}{\partial a} (ka^{k-1}) \right] = \frac{\partial}{\partial a} \left[\frac{z}{(z - a)^2} \right] \\ &= \frac{2z}{(z - a)^3} = \frac{(2!)z}{(z - a)^3} \end{aligned}$$

$$\begin{aligned} \mathcal{Z} [k(k-1) \cdots (k-h+1)a^{k-h}] \\ &= \mathcal{Z} \left[\frac{\partial}{\partial a} k(k-1) \cdots (k-h+2)a^{k-h+1} \right] \\ &= \frac{\partial}{\partial a} X(z, a) \end{aligned}$$

where

$$X(z, a) = \frac{(h-1)! z}{(z - a)^h}$$

Hence

$$\begin{aligned} \mathcal{Z} [k(k-1) \cdots (k-h+1)a^{k-h}] &= \frac{\partial}{\partial a} X(z, a) \\ &= (h-1)! zh(z - a)^{-h-1} = \frac{h! z}{(z - a)^{h+1}} \end{aligned}$$

B-2-7.

From Figure 2-8 we have

$$\begin{aligned} x(0) = 0, \quad x(1) = 0, \quad x(2) = 0, \quad x(3) = \frac{1}{3} \\ x(4) = \frac{2}{3}, \quad x(k) = 1 \quad \text{for } k = 5, 6, 7, \dots \end{aligned}$$

Then

$$X(z) = \sum_{k=0}^{\infty} x(k) z^{-k}$$

$$\begin{aligned}
&= \frac{1}{3} z^{-3} + \frac{2}{3} z^{-4} + z^{-5} + z^{-6} + z^{-7} + \dots \\
&= \frac{1}{3} (z^{-3} + 2z^{-4}) + \frac{z^{-5}}{1 - z^{-1}} \\
&= \frac{1}{3} \frac{z^{-3} + z^{-4} + z^{-5}}{1 - z^{-1}}
\end{aligned}$$

B-2-8. By dividing both numerator and denominator by z^4 , we have

$$X(z) = 5 + 4z^{-1} + 3z^{-2} + 2z^{-3} + z^{-4}$$

This last equation is already in the form of a power series in z^{-1} . By inspection, we have

$$\begin{aligned}
x(0) &= 5 \\
x(1) &= 4 \\
x(2) &= 3 \\
x(3) &= 2 \\
x(4) &= 1 \\
x(k) &= 0 \quad k \geq 5
\end{aligned}$$

Note that the given $X(z)$ is the z transform of a signal of finite length.

B-2-9.

1. Partial-fraction-expansion method:

$$X(z) = \frac{z^{-1}(0.5 - z^{-1})}{(1 - 0.5z^{-1})(1 - 0.8z^{-1})^2} = \frac{z(0.5z - 1)}{(z - 0.5)(z - 0.8)^2}$$

Hence,

$$\frac{X(z)}{z} = -\frac{8.3333}{z - 0.5} + \frac{8.3333}{z - 0.8} - \frac{2}{(z - 0.8)^2}$$

or

$$X(z) = -\frac{8.3333}{1 - 0.5z^{-1}} + \frac{8.3333}{1 - 0.8z^{-1}} - \frac{2z^{-1}}{(1 - 0.8z^{-1})^2}$$

Thus,

$$x(k) = -8.3333(0.5)^k + 8.3333(0.8)^k - 2k(0.8)^{k-1}, \quad k = 0, 1, 2, \dots$$

2. Computational solution with MATLAB:

B-2-10.

$$x(0) = \lim_{z \rightarrow \infty} X(z) = \lim_{z \rightarrow \infty} \frac{z^{-1}}{(1 - z^{-1})(1 + 1.3z^{-1} + 0.4z^{-2})} = 0$$

$$x(\infty) = \lim_{z \rightarrow 1} [(1 - z^{-1})X(z)] = \lim_{z \rightarrow 1} \frac{z^{-1}}{1 + 1.3z^{-1} + 0.4z^{-2}} = \frac{1}{2.7}$$

Notice that

$$\begin{aligned} X(z) &= \frac{z^{-1}}{(1 - z^{-1})(1 + 1.3z^{-1} + 0.4z^{-2})} \\ &= \frac{z^2}{(z - 1)(z + 0.8)(z + 0.5)} \\ &= \frac{1}{2.7} \left(\frac{z}{z - 1} - \frac{4z}{z + 0.8} + \frac{3z}{z + 0.5} \right) \end{aligned}$$

Hence

$$x(k) = \frac{1}{2.7} \left[1 - 4(-0.8)^k + 3(-0.5)^k \right]$$

B-2-11.

1. Inversion integral method:

$$X(z) = \frac{1 + z^{-1} - z^{-2}}{1 - z^{-1}} = \frac{z^2 + z - 1}{(z - 1)z}$$

Hence

$$X(z)z^{k-1} = \frac{(z^2 + z - 1)z^{k-1}}{(z - 1)z}$$

For $k = 0$:

$$X(z)z^{k-1} = \frac{z^2 + z - 1}{(z - 1)z^2}$$

Thus,

$$\begin{aligned} x(0) &= \left[\text{residue of } \frac{z^2 + z - 1}{(z - 1)z^2} \text{ at pole } z = 1 \right] \\ &+ \left[\text{residue of } \frac{z^2 + z - 1}{(z - 1)z^2} \text{ at double pole } z = 0 \right] \\ &= \lim_{z \rightarrow 1} \left[(z - 1) \frac{z^2 + z - 1}{(z - 1)z^2} \right] \\ &+ \frac{1}{(2 - 1)!} \lim_{z \rightarrow 0} \frac{d}{dz} \left[z^2 \frac{z^2 + z - 1}{(z - 1)z^2} \right] = 1 + 0 = 1 \end{aligned}$$

For k = 1:

$$\begin{aligned} X(z)z^{k-1} &= \frac{z^2 + z - 1}{(z - 1)z} \\ x(1) &= \left[\text{residue of } \frac{z^2 + z - 1}{(z - 1)z} \text{ at pole } z = 1 \right] \\ &+ \left[\text{residue of } \frac{z^2 + z - 1}{(z - 1)z} \text{ at pole } z = 0 \right] \\ &= \lim_{z \rightarrow 1} \left[(z - 1) \frac{z^2 + z - 1}{(z - 1)z} \right] + \lim_{z \rightarrow 0} \left[z \frac{z^2 + z - 1}{(z - 1)z} \right] \\ &= 1 + 1 = 2 \end{aligned}$$

For k = 2, 3, 4, ...:

$$X(z)z^{k-1} = \frac{(z^2 + z - 1)z^{k-2}}{z - 1}$$

Hence

$$\begin{aligned} x(k) &= \left[\text{residue of } \frac{(z^2 + z - 1)z^{k-2}}{z - 1} \text{ at pole } z = 1 \right] \\ &= \lim_{z \rightarrow 1} \left[(z - 1) \frac{(z^2 + z - 1)z^{k-2}}{z - 1} \right] = 1 \end{aligned}$$

Therefore,

$$x(0) = 1$$

$$x(1) = 2$$

$$x(k) = 1 \quad \text{for } k = 2, 3, 4, \dots$$

2. Computational solution with MATLAB:

```

B-2-12.

$$\begin{aligned} X(z) &= \frac{z^{-3}}{(1 - z^{-1})(1 - 0.2z^{-1})} = \frac{1}{z(z - 1)(z - 0.2)} \\ &= \frac{5}{z} + \frac{1.25}{z - 1} - \frac{6.25}{z - 0.2} \end{aligned}$$

Hence

$$x(k) = 5 \delta_0(k - 1) + 1.25 - 6.25(0.2)^{k-1} \quad \text{for } k = 1, 2, 3, \dots$$

That is,

$$\begin{aligned} x(k) &= 0 \quad \text{for } k = 0, 1, 2 \\ &= 1.25(1 - 0.2^{k-2}) \quad \text{for } k = 3, 4, 5, \dots \end{aligned}$$

B-2-13.

$$\begin{aligned} X(z) &= \frac{1 + 6z^{-2} + z^{-3}}{(1 - z^{-1})(1 - 0.2z^{-1})} = \frac{z^3 + 6z + 1}{z(z - 1)(z - 0.2)} \\ X(z)z^{k-1} &= \frac{(z^3 + 6z + 1)z^{k-1}}{z(z - 1)(z - 0.2)} \end{aligned}$$

For k = 0:

$$X(z)z^{k-1} = \frac{z^3 + 6z + 1}{z^2(z-1)(z-0.2)}$$

Hence

$$\begin{aligned} x(0) &= \left[\text{residue of } \frac{z^3 + 6z + 1}{z^2(z-1)(z-0.2)} \text{ at double pole } z = 0 \right] \\ &+ \left[\text{residue of } \frac{z^3 + 6z + 1}{z^2(z-1)(z-0.2)} \text{ at pole } z = 1 \right] \\ &+ \left[\text{residue of } \frac{z^3 + 6z + 1}{z^2(z-1)(z-0.2)} \text{ at pole } z = 0.2 \right] \\ &= \frac{1}{(2-1)!} \lim_{z \rightarrow 0} \frac{d}{dz} \left[\frac{z^3 + 6z + 1}{(z-1)(z-0.2)} \right] \\ &+ \lim_{z \rightarrow 1} \left[\frac{z^3 + 6z + 1}{z^2(z-0.2)} \right] + \lim_{z \rightarrow 0.2} \left[\frac{z^3 + 6z + 1}{z^2(z-1)} \right] \\ &= 60 + 10 - 69 = 1 \end{aligned}$$

For k = 1:

$$X(z)z^{k-1} = \frac{z^3 + 6z + 1}{z(z-1)(z-0.2)}$$

Hence

$$\begin{aligned} x(1) &= \left[\text{residue of } \frac{z^3 + 6z + 1}{z(z-1)(z-0.2)} \text{ at pole } z = 0 \right] \\ &+ \left[\text{residue of } \frac{z^3 + 6z + 1}{z(z-1)(z-0.2)} \text{ at pole } z = 1 \right] \\ &+ \left[\text{residue of } \frac{z^3 + 6z + 1}{z(z-1)(z-0.2)} \text{ at pole } z = 0.2 \right] \\ &= \lim_{z \rightarrow 0} \left[\frac{z^3 + 6z + 1}{(z-1)(z-0.2)} \right] + \lim_{z \rightarrow 1} \left[\frac{z^3 + 6z + 1}{z(z-0.2)} \right] \\ &+ \lim_{z \rightarrow 0.2} \left[\frac{z^3 + 6z + 1}{z(z-1)} \right] = 5 + 10 - 13.8 = 1.2 \end{aligned}$$

For k = 2, 3, 4, ...:

$$X(z)z^{k-1} = \frac{(z^3 + 6z + 1)z^{k-2}}{(z-1)(z-0.2)}$$

$$\begin{aligned} x(k) &= \left[\text{residue of } \frac{(z^3 + 6z + 1)z^{k-2}}{(z-1)(z-0.2)} \text{ at pole } z = 1 \right] \\ &+ \left[\text{residue of } \frac{(z^3 + 6z + 1)z^{k-2}}{(z-1)(z-0.2)} \text{ at pole } z = 0.2 \right] \end{aligned}$$

$$\begin{aligned}
&= \lim_{z \rightarrow 1} \left[\frac{(z^3 + 6z + 1)z^{k-2}}{z - 0.2} \right] + \lim_{z \rightarrow 0.2} \left[\frac{(z^3 + 6z + 1)z^{k-2}}{z - 1} \right] \\
&= 10 - 2.76(0.2)^{k-2}
\end{aligned}$$

In summarizing, we have

$$\begin{aligned}
x(0) &= 1 \\
x(1) &= 1.2 \\
x(k) &= 10 - 2.76(0.2)^{k-2} \quad \text{for } k = 2, 3, 4, \dots
\end{aligned}$$

B-2-14.

1. Direct division method:

$$X(z) = \frac{z^{-1} - z^{-3}}{1 + 2z^{-2} + z^{-4}} = z^{-1} - 3z^{-3} + 5z^{-5} - 7z^{-7} + \dots$$

Hence

$$\begin{aligned}
x(0) &= 0, & x(1) &= 1, & x(2) &= 0, & x(3) &= -3 \\
x(4) &= 0, & x(5) &= 5, & x(6) &= 0, & x(7) &= -7, \dots
\end{aligned}$$

2. Computational solution with MATLAB:

```

B-2-15.

$$X(z) = \frac{0.368z^2 + 0.478z + 0.154}{(z-1)z^2}$$

$$X(z)z^{k-1} = \frac{(0.368z^2 + 0.478z + 0.154)z^{k-1}}{(z-1)z^2}$$

For k = 0:

$$X(z)z^{k-1} = \frac{0.368z^2 + 0.478z + 0.154}{(z-1)z^3}$$

$$\begin{aligned} x(0) &= \left[\text{residue of } \frac{0.368z^2 + 0.478z + 0.154}{(z-1)z^3} \text{ at triple pole } z = 0 \right] \\ &+ \left[\text{residue of } \frac{0.368z^2 + 0.478z + 0.154}{(z-1)z^3} \text{ at pole } z = 1 \right] \\ &= \frac{1}{(3-1)!} \lim_{z \rightarrow 0} \frac{d^2}{dz^2} \left[\frac{0.368z^2 + 0.478z + 0.154}{z-1} \right] \\ &+ \lim_{z \rightarrow 1} \left[\frac{0.368z^2 + 0.478z + 0.154}{z^3} \right] = -1 + 1 = 0 \end{aligned}$$

For k = 1:

$$X(z)z^{k-1} = \frac{0.368z^2 + 0.478z + 0.154}{(z-1)z^2}$$

$$\begin{aligned} x(1) &= \frac{1}{(2-1)!} \lim_{z \rightarrow 0} \frac{d}{dz} \left[\frac{0.368z^2 + 0.478z + 0.154}{z-1} \right] \\ &+ \lim_{z \rightarrow 1} \left[\frac{0.368z^2 + 0.478z + 0.154}{z^2} \right] = -0.632 + 1 = 0.368 \end{aligned}$$

For k = 2:

$$X(z)z^{k-1} = \frac{0.368z^2 + 0.478z + 0.154}{(z-1)z}$$

$$x(2) = \lim_{z \rightarrow 0} \left[\frac{0.368z^2 + 0.478z + 0.154}{z - 1} \right] + \lim_{z \rightarrow 1} \left[\frac{0.368z^2 + 0.478z + 0.154}{z} \right] = -0.154 + 1 = 0.846$$

For $k = 3, 4, 5, \dots$:

$$X(z)z^{k-1} = \frac{(0.368z^2 + 0.478z + 0.154)z^{k-3}}{z - 1}$$

$$x(k) = \lim_{z \rightarrow 1} \left[(0.368z^2 + 0.478z + 0.154)z^{k-3} \right] = 1$$

In summary, we have

$$x(0) = 0$$

$$x(1) = 0.368$$

$$x(2) = 0.846$$

$$x(k) = 1 \quad \text{for } k = 3, 4, 5, \dots$$

B-2-16.

Case 1:

$$u(k) = 1 \quad \text{for } k = 0, 1, 2, \dots$$

$$= 0 \quad \text{for } k < 0$$

The z transform of the given difference equation is

$$z^2X(z) - 1.3zX(z) + 0.4X(z) = U(z) = \frac{z}{z - 1}$$

or

$$X(z) = \frac{z}{(z - 0.8)(z - 0.5)(z - 1)} = -\frac{16.6666z}{z - 0.8} + \frac{6.6666z}{z - 0.5} + \frac{10z}{z - 1}$$

Hence

$$x(k) = -16.6666(0.8)^k + 6.6666(0.5)^k + 10 \quad \text{for } k = 0, 1, 2, \dots$$

Case 2:

$$u(0) = 1$$

$$u(k) = 0 \quad \text{for } k \neq 0$$

The z transform of the given difference equation is

$$(z^2 - 1.3z + 0.4)X(z) = U(z) = 1$$

or

$$X(z) = \frac{1}{(z - 0.8)(z - 0.5)} = \frac{3.3333}{z - 0.8} - \frac{3.3333}{z - 0.5}$$

Hence,

$$x(0) = 0$$

$$x(k) = 3.3333(0.8)^{k-1} - 3.3333(0.5)^{k-1}, \quad \text{for } k = 1, 2, 3, \dots$$
